

Custom Medz × MAIA Proposal

Prepared for: Custom Medz

Prepared by: Mindhive Asia

Date: 8 Apr 2026

1. Executive Summary

Custom Medz currently manages an important part of its order and operational workflow through a process that still depends heavily on WhatsApp groups, manual checking, follow-up messages, and staff interpretation of prescriptions and remarks.

Doctors send prescriptions through WhatsApp, sometimes in electronic form, sometimes as photos, and sometimes with handwritten amendments. This creates a workflow where staff are not only processing orders, but also interpreting messy inputs, checking details manually, and coordinating exceptions through chat.

As order handling becomes more complex, this creates avoidable risk. Orders can be missed in the group, comments can be buried between messages, customer-specific handling notes can be forgotten, and payment follow-up can become delayed or unclear. The client also operates in a sensitive healthcare environment where patient data handling, data protection, and process traceability matter.

MAIA is proposed as an operational layer that sits on top of AutoCount and the current WhatsApp-based intake environment to help Custom Medz handle its day-to-day workflows more consistently through WhatsApp and a structured backend workspace.

MAIA is not positioned as an AutoCount replacement. Instead, it is designed to improve how the team captures requests, applies business rules, prepares drafts, tracks status, and manages follow-up.

This proposal recommends a Phase 1 rollout focused on the highest-priority operational workflows first. The immediate goal is to create a cleaner and more controlled intake-to-processing flow while clearly separating deeper pharmacy-specific requirements under customization.

With the recommended rollout, Custom Medz should expect:

- less manual checking and repeated cross-referencing in WhatsApp

- more consistent handling of doctor orders, customer-specific pricing references, and payment follow-up
- reduced dependency on staff memory for delivery remarks and customer preferences
- clearer internal visibility and accountability through a backend workspace
- a stronger operational foundation to support growth without increasing admin effort in the same proportion

2. Our Understanding of the Current Business Issues

2.1 Messy prescription and order intake through WhatsApp

Custom Medz currently receives doctor-generated prescriptions and order instructions through WhatsApp groups. These can be typed messages, electronically filled prescriptions, photos, and handwritten prescriptions. In practice, several patient orders may be sent together, with later clarifications appearing between other messages. This makes the intake process hard to follow and increases the risk that one patient order is missed or misread.

Today, this means the team often has to read through scattered chat threads, refer back to earlier messages, and reconstruct what the correct order should be. This creates unnecessary delay, inconsistency, and dependency on individual staff judgment.

2.2 Important operational instructions are not carried forward consistently

Custom Medz also faces operational difficulty in preserving important customer-specific and delivery-specific handling notes. Some customers have unusual receiving times, early lunch closures, or other special handling expectations. These are often communicated verbally or remembered informally. The team wants these details to flow into downstream remarks so they are not forgotten.

Because this is handled manually today, it increases the risk of wrong delivery timing, avoidable extra cost, and inconsistent customer treatment.

2.3 Payment follow-up is not as structured as it should be

Another key issue is payment handling and follow-up. The team receives payment slips and needs visibility into the payment date, payment amount, and whether the payment fully closes the order. Where checking is delayed or partial, the team needs a clearer way to identify the outstanding balance and follow up accordingly.

This means the team is not just processing work. The team is also spending time interpreting, checking, and coordinating what should happen next.

2.4 Management control is limited by fragmented execution

Management visibility is also affected because much of the process is driven by chat, memory, and manual interpretation. This makes it harder to review exceptions, track what has happened on each order, and maintain a reliable trail of actions and linked documents.

Without a stronger operational layer, it becomes harder to maintain control, review exceptions, and scale workflows consistently in a regulated environment.

2.5 Why this matters commercially

The issues above do not only create admin inconvenience. They also affect the business more broadly by causing:

- slower processing time
- heavier reliance on manual staff effort
- increased risk of missed orders or wrong handling
- more back-and-forth across teams
- weaker control over customer-specific treatment and delivery instructions
- delayed payment follow-up
- difficulty scaling operations cleanly in a regulated environment

3. Proposed Solution Overview

3.1 What MAIA is in this proposal

In this rollout, MAIA will act as a WhatsApp-based operational assistant with backend visibility for Custom Medz.

3.2 How MAIA will fit into the client' s environment

MAIA will work together with AutoCount, the current WhatsApp-based intake process, and the agreed internal workflows.

Rather than replacing AutoCount, MAIA is designed to improve the operational layer around it. This includes helping staff forward requests into MAIA, reference the correct customer and item information, prepare order drafts for review, capture payment-related evidence, preserve remarks, support agreed workflow logic, and track workflow status more clearly.

MAIA will be **deployed and maintained by Mindhive within Custom Medz' s environment** as part of the agreed setup.

3.3 What changes after implementation

After implementation, the team should no longer need to rely only on manual interpretation and scattered follow-up to move work forward.

Instead:

- doctor prescriptions and order messages can be forwarded into MAIA
- MAIA references the agreed customer, item, and pricing information
- MAIA prepares the next step for staff review
- users review and confirm where needed
- payment and remark-related information can be surfaced more clearly
- status and activity are tracked through the backend workspace
- management gets better visibility into open tasks and workflow progress

4. Phase 1 Scope Included in This Proposal

4.1 Phase 1 objective

Phase 1 is designed to establish the core operational workflow first, so Custom Medz can start seeing practical improvement without waiting for every advanced use case to be built upfront.

4.2 Included workflows

The recommended Phase 1 rollout includes the following agreed workflows:

- forwarding doctor prescriptions and WhatsApp order requests into MAIA for structured intake
- draft preparation for order processing based on forwarded prescription and order information
- reference checking against customer, item, and pricing data from the agreed source
- payment slip and payment evidence handling for clearer follow-up visibility
- customer preference and operational remark capture for downstream execution
- backend workspace visibility for staff and management
- workflow status and activity visibility

4.3 Included capabilities

Phase 1 includes:

- internal-facing WhatsApp workflow for staff
- request intake forwarding
- draft preparation for review

- confirmation flow before final submission
- agreed business-rule support
- item, customer, and pricing reference support
- payment slip visibility support
- activity trail
- document trail
- workflow status tracking
- backend visibility for agreed operational flows

4.4 Documents included

The following document support is included in the agreed Phase 1 scope:

- order draft support based on forwarded prescription and order inputs
- invoice-related reference support through the AutoCount-linked operating flow
- payment slip or payment evidence capture for follow-up visibility
- delivery-related remarks support
- revision support at the review stage before confirmation

4.5 What goes live at the end of Phase 1

At the end of Phase 1, Custom Medz will have a working operational workflow where agreed internal users can use MAIA to handle WhatsApp-based order intake, review prepared drafts, reference the correct customer and pricing information, preserve important remarks, and track operational progress through the backend workspace.

5. Customization Scope Client-Specific Requirements

5.1 How we define customization

Customization refers to workflows, rules, document behavior, reporting requirements, or exception handling logic that go beyond MAIA's standard rollout structure and require client-specific design, configuration, validation, or build work.

5.2 Customization handling principle

To avoid confusion, client-specific customizations should be separated clearly from standard rollout scope.

Each customization below explains:

- the business need
- the current challenge
- what MAIA will do
- why it is treated as customization
- the recommended phase
- the commercial treatment

5.3 Customization write-up format

Customization 1, Alternate delivery address extraction from doctor prescriptions

Business need

In some cases, the doctor places the order, but the medicine must be delivered to the patient's address rather than the clinic or normal source address.

Current challenge

The doctor may include a patient's delivery address that differs from the doctor's occupational address. These need to be reliably identified and applied correctly during order preparation so the wrong address is not used downstream.

What MAIA will do

MAIA would support this by asking which patient's delivery address should be applied, then surfacing the selected alternate delivery address clearly in the draft workflow for staff review before processing.

Why this is considered customization

This goes beyond standard order intake because it involves client-specific handling of alternate delivery destinations tied to prescription context.

Recommended phase

Phase 2, or Phase 1 only if sample validation is done early and confirmed feasible.

Commercial treatment

Optional add-on, separately scoped unless explicitly included after validation with real samples.

Customization 2, Multi-ingredient raw material deduction logic for compounded products

Business need

Custom Medz needs better support for products that are made from multiple raw ingredients in different quantities.

Current challenge

Simple one-ingredient deduction is straightforward, but more complex compounded products can contain several ingredients, with some products reaching as many as seven or eight ingredients. AutoCount is weak for this use case and the team is not currently handling the more complex deduction logic properly.

What MAIA will do

MAIA would support this by referencing the connected Google Sheet storing the ingredients list, checking the ingredients needed for the compounded product, and deducting the relevant ingredient quantities in the Google Sheet accordingly when the order is created.

Why this is considered customization

This is not a standard sales operations workflow. It is a pharmacy-specific inventory and formulation logic requirement that goes beyond standard MAIA order processing scope.

Recommended phase

Phase 2.

Commercial treatment

Optional add-on, separately scoped.

Customization 3, Statement of Account generation and follow-up support

Business need

The client needs a clearer way to prepare and review customer Statement of Account reports for receivables follow-up.

Current challenge

Payment follow-up today depends on manual checking and interpretation of what has been paid, what is still outstanding, and what should be chased. This makes finance and collection follow-up less structured than it should be.

What MAIA will do

MAIA would support the preparation of a Statement of Account view or report tied to the relevant customer account, so the team can more easily review outstanding balances and use that for receivables follow-up.

Why this is considered customization

This goes beyond basic payment evidence capture and enters client-specific finance reporting and collection workflow support.

Recommended phase

Phase 2, unless specifically prioritized into Phase 1.

Commercial treatment

Optional add-on, separately scoped unless explicitly included in the final agreed rollout.

5.4 Customization summary

The main client-specific requirements that should be treated separately from standard rollout are:

- alternate delivery address extraction from prescription content
- multi-ingredient raw material deduction logic
- Statement of Account generation and follow-up support

6. Key Workflow Scenarios

6.1 Scenario A, Normal order creation

1. Staff forwards the doctor's prescription or order message into MAIA.
2. MAIA extracts the relevant order details.
3. MAIA references agreed customer, item, and pricing information.
4. MAIA prepares a draft order for staff review.
5. Staff checks the draft and confirms it.
6. The order is ready for the next step, with status tracked in the backend workspace.

6.2 Scenario B, Staff asking about prices

1. Staff asks MAIA for the price of a product or item.
2. MAIA references the agreed pricing source and customer context.
3. MAIA returns the relevant pricing information clearly.
4. Staff uses that information to respond faster and prepare the correct order draft.
5. This reduces delay, manual checking, and wrong-price risk.

6.3 Scenario C, Alternative delivery address exception

1. Staff forwards the prescription or order message into MAIA.
2. MAIA asks which patient's delivery address should be applied.
3. MAIA surfaces the alternate delivery address clearly in the draft workflow.
4. Staff reviews and confirms the correct delivery destination.
5. The final order draft reflects the confirmed alternate address before processing.

6.4 Scenario D, Ingredients deduction for compounded products

1. MAIA creates the order after staff review and confirmation.
2. MAIA references the connected Google Sheet storing the ingredients list.
3. MAIA checks the ingredients needed for the compounded product.
4. MAIA deducts the relevant ingredient quantities in the Google Sheet accordingly.
5. This gives the team a structured way to track raw material usage.

6.5 Scenario E, Payment follow-up and Statement of Account workflow

1. The team forwards payment slip or payment-related evidence into MAIA.
2. MAIA captures the visible payment details for review.
3. Users check whether the payment date and amount align with the expected amount.
4. If there is a shortfall or unresolved balance, the team can review the customer's Statement of Account view or report.
5. The team uses this to follow up on outstanding balances more clearly and consistently.

7. Implementation Approach

7.1 Implementation stages

Implementation is expected to proceed in the following order:

1. Kickoff and workflow confirmation
2. Logic and configuration design
3. System setup
4. Integration setup
5. User acceptance testing

6. Training

7. Go-live support

7.2 What Mindhive will do

Mindhive will:

- confirm the agreed workflow design
- configure the agreed business rules
- set up the required customer, item, and pricing references
- implement the agreed integrations
- support testing and issue clarification
- conduct training for the agreed users
- support rollout for the agreed scope
- deploy the system within Custom Medz' s environment as part of the agreed implementation setup

7.3 What the client will need to provide

Custom Medz will need to provide:

- relevant system access or vendor coordination for AutoCount and agreed Google Sheet logic
- customer, item, pricing, and reference data
- sample prescriptions and existing flow references
- sample payment slips
- clarification on rules, exceptions, and desired outcomes
- internal PICs for review and sign-off
- relevant access, technical coordination, or environment support required for deployment within Custom Medz' s environment
- UAT users and timely feedback during testing

This is important to ensure the project moves smoothly and expectations remain aligned.

8. Timeline

8.1 Indicative timeline

Phase	Scope	Estimated Timeline
Phase 1	Core: B2B Sales Agent chatbot + backend integration Includes: • Internal-facing Sales Agent bot • Sales order workflow aligned to Custom Medz SOP • User roles + permissions • Integration approach agreed (ERP/accounting + master data sync) • Basic outputs (SO/quotation/invoice outputs depending on your flow) • Training + go-live support	3 to 4 weeks

8.2 Timeline notes

Timeline may vary depending on:

- access to AutoCount or related environment
- turnaround time for data and rule clarification
- speed of internal review and feedback
- the depth of client-specific customization required
- the availability of real sample prescriptions and edge cases for validation

9. Commercials

9.1 One-time implementation fee

Scope	What it covers	One-time fee (RM)
Phase 1: Base MAIA	Core: B2B Sales Agent chatbot + backend integration Includes: • Internal-facing Sales Agent bot • Sales order workflow aligned to Custom Medz SOP • User roles + permissions • Integration approach agreed (ERP/accounting + master data sync)	RM 20,000

	• Basic outputs (SO/quotation/invoice outputs depending on your flow) • Training + go-live support	
--	--	--

9.2 Customization pricing

Scope	What it covers	One-time fee (RM)
Customizations	1. Applying Customer Delivery Address in Delivery Order 2. Multi-Ingredient Raw Material Deduction 3. Statement of Account Generation	RM 6,000

9.3 Monthly subscription

Tier	Orders/month cap	Monthly fee (RM)
T1	Up to 500	RM 2,500

9.4 What the monthly subscription covers

The monthly subscription covers:

- platform access
- standard support for agreed scope
- ongoing system usage
- bug fixes within agreed scope
- standard operational maintenance for the subscribed setup

9.5 Payment terms

Milestone	Percentage	Payment Trigger
Upfront payment	50%	Upon project confirmation
Completion of UAT	50%	Upon completion of UAT

9.6 Commercial notes

- **Monthly subscription will commence upon completion of Phase 1 UAT sign-off, unless otherwise agreed in writing.**

10. Assumptions and Exclusions

10.1 Assumptions

This proposal assumes that:

- MAIA system will be hosted in Custom Medz' s environment, unless otherwise stated in writing.
- MAIA will sit on top of AutoCount, not replace it
- the agreed workflows can be clearly documented during kickoff
- required master data, pricing references, Google Sheet structures, and reference data will be provided by the client
- ambiguous or edge-case scenarios may still require human confirmation unless specifically customized
- implementation progress depends partly on the availability of client-side reviewers and vendor responsiveness where relevant

10.2 Exclusions

Unless otherwise stated, this proposal does not include:

- full ERP replacement
- major restructuring of AutoCount or the client' s accounting environment
- full compounding ERP or formulation-engine replacement
- custom workflows outside the agreed Phase 1 scope
- advanced dashboards or reports beyond agreed standard visibility
- third-party implementation work outside Mindhive' s agreed scope
- additional customizations not listed in this proposal

11. Success Criteria for Phase 1

Phase 1 will be considered successfully delivered when:

- the agreed workflows are configured and available for use
- the agreed users are trained

- agreed test cases pass during UAT
- the agreed operational draft and review flow is functioning as intended
- the agreed visibility features are live
- the client signs off on the agreed rollout scope

12. Recommended Next Steps

To proceed, we recommend the following next steps:

1. Confirm acceptance of the proposed Phase 1 scope
2. Confirm customization selections
3. Confirm commercial acceptance
4. Appoint implementation PICs from both sides
5. Schedule kickoff workshop
6. Begin data, rule, and workflow confirmation for setup

13. Acknowledgement & Agreement

This document serves as the agreed scope, commercials, responsibilities, and exclusions for MAIA' s implementation for Custom Medz. By signing below, both parties agree to the items set out herein.
