

Industrial Automation × MAIA Proposal v2

Prepared for: Industrial Automation

Prepared by: Mindhive Asia

Date: 21 May 2026

1. Executive Summary

Industrial Automation currently manages important parts of its sales and operational workflow through a process that still depends heavily on manual coordination, WhatsApp communication, staff checking, repeated follow-up, Excel tracking, and internal handoffs.

Today, customer inquiries, quotation requests, and sometimes orders come through WhatsApp. The sales team then needs to manually review the messages, prepare quotations, check prices, manage approval requirements, transfer relevant information into Navision, proceed to sales order, and eventually generate invoices. This process also involves warehouse, delivery, and management approval where pricing, discounts, credit limits, or exceptions are involved.

Based on the latest information provided by Industrial Automation after the initial meeting, Industrial Automation currently processes approximately 1,350 orders per month. This makes sales coordination, quotation handling, approval control, and order visibility increasingly important as daily operating volume grows.

The company is currently using Navision and has mentioned that it may consider changing to Microsoft Dynamics in the future. Because of this, the integration approach should be handled carefully to avoid unnecessary rework and double integration cost.

MAIA is proposed as an internal WhatsApp-based operational assistant and backend visibility layer that supports Industrial Automation's sales and order workflow. MAIA is not positioned as a replacement for Navision or the future ERP system. Instead, it is designed to improve how the team captures requests, checks information, applies business rules, prepares drafts, generates documents, tracks status, and manages follow-up.

This proposal recommends a Phase 1 rollout focused on the highest-priority sales and order workflow first. The objective is to establish a practical working foundation that reduces manual work and improves control early, while keeping client-specific requirements clearly separated under customization scope.

With the recommended rollout, Industrial Automation should expect:

- less manual checking and repeated key-in work
- more consistent handling of inquiries, quotations, sales orders, and documents
- stronger control over quotation approval, discounts, pricing rules, and credit limit exceptions
- clearer visibility over open quotations and pending order progress
- better salesperson activity record keeping through submitted location, documents, and photos
- reduced dependency on staff memory, WhatsApp searching, and manual Excel tracking
- a stronger operational foundation to support future ERP transition

2. Our Understanding of the Current Business Issues

2.1 Heavy Dependency on WhatsApp for Inquiries, Quotations, and Orders

Industrial Automation currently relies heavily on WhatsApp as a primary communication channel for inquiries, quotations, and sometimes orders.

This means salespeople need to monitor WhatsApp conversations, identify important customer requests, interpret the information, and manually transfer details into Navision or the relevant internal workflow.

Because salespeople are often out visiting customers or driving, there is a risk that important inquiries, pricing requests, or order details may be missed, delayed, or handled inconsistently.

2.2 Manual Sales Workflow from Visit to Quotation to Sales Order

The current sales process still involves manual sales activity recording. After visiting customers, salespeople issue quotations. After quotation, the process proceeds to sales order and then invoice.

This creates repeated administrative work across the sales cycle. The team is not only selling to customers, but also recording activities, checking details, preparing documents, following up internally, and manually ensuring the next step happens.

Over time, this increases dependency on experienced staff and makes it harder to scale sales operations cleanly.

2.3 Manual Transfer of Information into Navision

Industrial Automation currently uses Navision as its existing system for customer information, inventory, pricing, and related business data.

When information comes through WhatsApp, the team needs to manually transfer relevant information into Navision. This creates duplicate work and increases the risk of errors in customer details, item details, pricing, quantity, or order status.

2.4 Future ERP Change May Affect Integration Decisions

Industrial Automation mentioned that it may consider changing from Navision to Microsoft Dynamics in the future.

This is important because integrating with Navision now may solve immediate workflow needs, but if the company changes ERP later, a second integration may be required. Therefore, the integration approach should be decided based on timing, cost, urgency, and how much automation is needed before the ERP change happens.

2.5 Approval and Pricing Control Requirements

Industrial Automation needs approval controls for quotation-level approval, discounts, pricing exceptions, and credit limit exceeded scenarios.

Without a structured approval flow inside MAIA, there is a risk that exceptions may be handled inconsistently or outside management control.

These approval rules are important because salespeople may not always have the authority to proceed with certain pricing, discount, or credit decisions.

2.6 Sales Activity Tracking is Currently Manual

Management wants better visibility into sales activity, including customer visits and supporting visit records.

Today, sales activity is still dependent on manual updates and Excel tracking. This makes it harder for management to review salesperson activity in a structured way.

Industrial Automation has requested for salespeople to be able to submit location, documents, and photos to MAIA as part of sales activity tracking.

It is important to note that this function is intended for salesperson activity record keeping. MAIA will store information submitted by the salesperson, such as location, documents, and photos, but it will not independently verify whether a salesperson physically visited a customer unless a separate GPS attendance or visit verification module is scoped.

2.7 Quotation Follow-Up Visibility is Important

Industrial Automation wants visibility over quotations that are still open and have not yet been converted into Sales Orders.

This does not need to be treated as a customization because MAIA can already filter quotations by date and show open quotations that have not yet been generated into Sales Orders.

This helps the team identify pending quotation follow-ups without requiring a separate custom quotation conversion dashboard.

2.8 Why This Matters Commercially

The issues above do not only create administrative inconvenience. They also affect the business more broadly by causing:

- slower processing time
- higher dependency on manual staff effort
- increased risk of missed inquiries or delayed response
- increased risk of wrong pricing, wrong item, or wrong document handling
- more back-and-forth across sales, warehouse, delivery, and management
- weaker visibility over quotation follow-up and sales activity
- difficulty tracking execution consistently
- unnecessary rework if ERP integration is not planned carefully
- reduced management control over approvals and exceptions

3. Proposed Solution Overview

3.1 What MAIA is in This Proposal

In this rollout, MAIA will act as an internal WhatsApp-based sales operations and order coordination layer for Industrial Automation.

MAIA will help staff forward customer inquiries, quotation requests, POs, text messages, voice notes, or images into a structured workflow. MAIA will then assist with extracting relevant information, checking the agreed business rules, preparing drafts, supporting document generation, and updating status through the backend workspace.

3.2 How MAIA Will Fit into Industrial Automation's Environment

MAIA will work together with Industrial Automation's current Navision system, WhatsApp-based communication flow, and agreed internal approval process.

Rather than replacing Navision, MAIA is designed to improve the operational layer around it. Navision remains the current data environment for important business information such as customers, inventory, pricing, and related records.

MAIA will help the team interact with this information more easily through WhatsApp and backend visibility. This includes:

- capturing customer requests more cleanly
- referencing customer, item, pricing, stock, and credit information
- preparing drafts for user review
- supporting document handling
- enforcing approval guardrails where required
- tracking workflow status
- providing activity and document trails
- giving management better visibility over sales operations

3.3 What Changes After Implementation

After implementation, the team should no longer need to rely only on manual interpretation, scattered WhatsApp follow-up, and Excel tracking to move work forward.

Instead:

- customer requests can be forwarded into MAIA
- MAIA identifies the customer and item information
- MAIA references the agreed rules and prepares the next step
- users review and confirm before final submission
- pricing, stock, overdue payment, and credit checks can be surfaced before proceeding
- approvals can be requested where the user does not have authority
- salespeople can submit activity records such as location, documents, and photos for management reference
- documents and status are tracked more clearly
- management gets better operational visibility through the backend workspace
- customer creation and customer profile updates can be controlled based on user role and approval rules, if required

4. Phase 1 Scope: Included in This Proposal

4.1 Phase 1 Objective

Phase 1 is designed to establish the core sales and order coordination workflow first, so Industrial Automation can start seeing practical improvement without waiting for every

advanced use case to be built upfront.

The goal of Phase 1 is to reduce manual WhatsApp-to-system handling, improve internal control, and provide clearer visibility across inquiry, quotation, order, document, and fulfillment status.

4.2 Included Workflows

The recommended Phase 1 rollout includes the following workflows:

- WhatsApp-based internal request intake
- customer inquiry and quotation request handling
- draft quotation or sales order preparation for user review
- customer, item, pricing, stock, credit, and overdue payment reference checks
- standard quotation filtering by date and open quotation status
- document generation support for agreed sales documents
- backend status tracking for quotations, sales orders, invoices, and related documents
- activity trail to show who changed what and when
- document trail to keep related sales documents in one place
- daily digest or task reminder flow for pending operational actions
- role-based access for sales, management, warehouse, logistics, and finance users where applicable
- customer creation and customer profile update control, subject to the agreed user roles and approval process

4.3 Included Capabilities

Phase 1 includes:

- internal-facing WhatsApp workflow for staff
- request intake forwarding from WhatsApp
- extraction of customer and item details from supported message formats
- draft preparation for review
- confirmation flow before final submission
- agreed business-rule support
- customer reference support
- item and SKU reference support
- pricing reference support

- stock availability checking
- credit limit and overdue payment checking
- quotation filtering by date
- open quotation visibility before conversion into Sales Orders
- document handling for agreed sales flows
- activity trail
- document trail
- quotation or order status tracking
- backend visibility for agreed operational flows
- user identity tracking through phone number and backend login
- restricted customer creation and customer profile update access based on agreed user roles

4.4 Documents Included

The final document list for Phase 1 will be confirmed during kickoff based on Industrial Automation's actual Navision document formats and operating process.

The initial Phase 1 document scope includes:

- quotation
- sales order
- sales invoice
- pick and pack list
- delivery note
- proof of delivery attachment

4.5 What Goes Live at the End of Phase 1

At the end of Phase 1, Industrial Automation will have a working internal MAIA workflow where agreed users can use WhatsApp and the backend workspace to:

- forward customer inquiries, quotation requests, or order details into MAIA
- prepare drafts for review
- check customer, item, stock, credit, overdue payment, and pricing information
- generate agreed sales documents
- track quotation, order, invoice, and fulfillment progress
- filter open quotations by date and review quotations not yet converted into Sales Orders

- view related documents in a structured document trail
- review activity history for accountability
- monitor pending tasks through dashboard and digest views

5. Customization Scope: Client-Specific Requirements

5.1 How We Define Customization

Customization refers to workflows, rules, approvals, document behavior, reporting requirements, or exception handling logic that go beyond MAIA's standard rollout structure and require client-specific design, configuration, validation, or build work.

These are usually needed where the client has:

- account-specific business rules
- non-standard approvals
- complex approval conditions
- special pricing behavior
- custom sales activity tracking needs
- custom submission requirements
- deep exception handling

5.2 Customization Handling Principle

To avoid confusion, client-specific customizations should be separated clearly from standard rollout scope.

Each customization should explain:

- the business need
- the current challenge
- what MAIA will do
- why it is treated as customization
- the recommended phase
- its commercial treatment

5.3 Customization 1: Approval Flows

Business Need

Industrial Automation needs MAIA to support approval controls at quotation level and for key sales exceptions. Industrial Automation also requires control over customer creation and customer profile updates, so that salespeople cannot freely create or update customer records without the required documentation, credit checks, or management/admin review.

This includes approval flows for:

- quotation-level approval
- any discounts applied
- pricing exceptions based on the agreed minimum selling price rule
- customer credit limit exceeded scenarios
- new customer creation or customer profile update approval, if required

Current Challenge

Industrial Automation already has internal controls for pricing, discounts, rebates, and credit-related exceptions. These approvals are important because salespeople may not always have the authority to proceed with certain pricing or credit decisions.

Without a structured approval flow inside MAIA, there is a risk that exceptions may be handled inconsistently or outside management control.

What MAIA Will Do

MAIA can be customized to apply approval guardrails during the quotation or sales order process.

For example:

1. A salesperson prepares a quotation through MAIA.
2. MAIA checks whether a discount is applied.
3. MAIA checks whether the price falls outside the agreed pricing rule.
4. MAIA checks whether the customer has exceeded the credit limit.
5. If approval is required, MAIA stops the workflow from proceeding automatically.
6. MAIA routes the request to the relevant approver.
7. Once approved, MAIA allows the quotation or sales order to proceed.
8. If a user attempts to create a new customer or update important customer profile information, MAIA can restrict the action or route it for approval based on the agreed user role and approval matrix.

Why This is Considered Customization

The approval logic needs to reflect Industrial Automation's internal control structure, including how approvals are triggered, who approves, and what conditions require management review.

Recommended Phase

Phase 1, if approval control is required before go-live.

Commercial Treatment

One-time customization fee: RM3,000, waived as FOC for this Phase 1 rollout, subject to the approval matrix being finalized during kickoff.

5.4 Customization 2: Sales Activity Tracking

Business Need

Industrial Automation wants better visibility into salesperson activity and customer visits. The requested sales activity tracking scope includes allowing salespeople to send the following to MAIA:

- location
- documents
- photos

This helps create a clearer activity record for management and future reference.

Current Challenge

Sales activity is currently tracked manually, including customer visits, activities, quotation value, and conversion. This creates additional admin work and makes it harder for management to review salesperson activity in a structured way.

What MAIA Will Do

MAIA can be customized to allow salespeople to submit activity updates through WhatsApp.

For example:

1. A salesperson visits a customer.
2. The salesperson submits location information to MAIA, where required.
3. The salesperson uploads related documents or photos to MAIA.
4. MAIA stores the submitted information against the relevant customer or activity record.
5. Management can refer to the submitted records for sales activity visibility and follow-up.

This sales activity tracking function records information submitted by the salesperson. It does not independently verify whether the salesperson physically visited the customer, and it should not be treated as GPS attendance verification unless separately scoped.

Why This is Considered Customization

This goes beyond the standard quotation and sales order workflow. It is specific to Industrial Automation's need to track salesperson activity and supporting visit records.

Recommended Phase

Phase 1 or Phase 2, depending on priority.

Commercial Treatment

One-time customization fee: RM3,000

5.5 Not Handled as Customization: Quotation Conversion Visibility

Quotation conversion visibility is not treated as a customization.

Reason

MAIA can already filter quotations by date and show open quotations that have not yet been generated into Sales Orders.

This means Industrial Automation can review quotations that are still open and pending conversion without requiring a separate custom quotation conversion dashboard.

How This Will Be Positioned

This will be positioned under standard quotation visibility and standard MAIA usage.

MAIA allows users to filter quotations by date and review open quotations that have not yet been converted into Sales Orders. This helps the team identify pending quotation follow-ups without requiring a separate custom quotation conversion dashboard.

5.6 Customization Summary

Customization	Business Value	Commercial Treatment
Approval flows for quotation, discounts, pricing rule exceptions, and credit limit exceeded scenarios	Strengthens control over quotation approval, discounting, pricing exceptions, and credit exposure	FOC, RM3,000 waived
Sales activity record keeping with location, document, and photo submission to MAIA	Improves management visibility over customer visits and salesperson activity	RM3,000

Quotation conversion visibility is not treated as a customization because MAIA can already filter quotations by date and show open quotations that have not yet been generated into Sales Orders.

6. Navision Integration Approach

6.1 Why Integration Should Be Planned Carefully

Industrial Automation is currently using Navision and has mentioned that the company may change to Microsoft Dynamics in the future.

Because of this, the integration approach should be decided carefully. The main consideration is whether Industrial Automation wants to integrate with Navision now, or avoid immediate integration work and only integrate when the new ERP system is ready.

6.2 Option 1: Start Without Direct Navision Integration First

Under this option, MAIA can be set up without direct integration to Navision at the beginning.

Industrial Automation would export the required reference data from Navision, such as:

- customer list
- customer-specific price list
- item list
- credit limit
- other agreed master data references

MAIA can then use these exported references to support the initial workflow. Once Industrial Automation moves to the new ERP system, MAIA can integrate with the new ERP system directly.

Suitable If

- Industrial Automation expects to change ERP soon
- the team wants to avoid paying for integration twice
- exported customer and price list references are sufficient for Phase 1
- real-time sync is not required during the first rollout

Under Option 1, MAIA will not automatically push or pull live transactional updates from Navision. Customer, item, pricing, stock, credit limit, and outstanding information will depend on the exported data provided by Industrial Automation and the agreed update frequency.

Any final entry, posting, or reconciliation in Navision remains Industrial Automation's responsibility unless direct integration is selected.

Commercial Treatment

This approach avoids immediate Navision integration cost. Integration cost will only be scoped when the new ERP system is ready.

6.3 Option 2: Integrate with Navision Now, Then Integrate Again After ERP Change

Under this option, MAIA can integrate with Navision now to support a tighter data flow with the current system.

When Industrial Automation later changes to a new ERP system, MAIA will need to integrate again with the new ERP environment.

Suitable If

- Industrial Automation needs tighter system integration now
- real-time or more automated data sync is important from the start
- the ERP change may take longer than expected
- the team wants to reduce manual export and update work during the interim period

Commercial Treatment

This option will come with an additional integration cost.

Estimated Navision integration cost: RM5,000 to RM10,000, depending on:

- document types involved
- data fields required
- sync direction

- complexity of Navision access
- whether customer, item, price list, quotation, sales order, invoice, or other documents need to be handled
- level of testing and validation required

If Industrial Automation later changes to a new ERP system, the new ERP integration will be scoped and charged separately.

6.4 Integration Options Summary

Option	What it covers	Commercial Treatment
Option 1: No direct Navision integration first	Industrial Automation exports required references from Navision. MAIA uses the exported customer and price list data for initial setup. ERP integration can be done later when the new ERP is ready.	No immediate Navision integration fee. Future ERP integration to be scoped separately.
Option 2: Integrate with Navision now	MAIA connects with Navision now based on agreed document types, data fields, and sync requirements. If Industrial Automation later changes ERP, a second integration will be required.	RM5,000 to RM10,000, depending on document types and complexity. Future ERP integration to be scoped separately.

7. Key Workflow Scenarios

7.1 Scenario A: WhatsApp Inquiry to Draft Quotation

1. Customer sends an inquiry or quotation request to the salesperson through WhatsApp.
2. Salesperson forwards the message, PDF, image, or voice note to MAIA.
3. MAIA identifies the customer and item details.
4. MAIA checks customer, item, stock, pricing, credit limit, and overdue payment information based on available references.
5. MAIA prepares a draft quotation for the salesperson to review.
6. Salesperson confirms or adjusts the draft.
7. If no approval is required, MAIA proceeds with the agreed document workflow.
8. The quotation status and related documents are tracked in the backend workspace.

7.2 Scenario B: Sales Order Processing with Stock and Credit Check

1. Salesperson forwards an accepted order or PO to MAIA.
2. MAIA extracts the customer, items, quantity, and order details.
3. MAIA checks stock availability.
4. MAIA checks whether the customer has exceeded credit limit or has overdue payment.
5. If there is an issue, MAIA alerts the user and asks for confirmation or approval.
6. Once the user confirms, MAIA prepares the sales order draft.
7. The user reviews the sales order before final submission.
8. Sales order status is updated in the backend workspace.

7.3 Scenario C: Approval Flow for Quotation, Discount, Pricing, or Credit Exception

1. Salesperson prepares a quotation or sales order through MAIA.
2. MAIA detects that approval is required.
3. This may happen because the quotation requires approval, a discount is applied, pricing falls outside the agreed pricing rule, or the customer has exceeded the credit limit.
4. MAIA stops the workflow from proceeding automatically.
5. MAIA routes the approval request to the relevant approver.
6. The approver reviews and approves or rejects the request.
7. If approved, MAIA allows the quotation or sales order to proceed.
8. The approval action is recorded in the activity trail.

7.4 Scenario D: Open Quotation Follow-Up

1. Salesperson issues a quotation through MAIA.
2. MAIA records the quotation status.
3. The quotation remains open until it is converted, marked lost, or cancelled.
4. Users can filter quotations by date.
5. Users can review open quotations that have not yet been generated into Sales Orders.
6. The team can follow up on pending quotations without requiring a separate custom quotation conversion dashboard.

7.5 Scenario E: Sales Activity Tracking

1. A salesperson visits a customer.

2. The salesperson submits location information to MAIA, where required.
3. The salesperson uploads related documents or photos to MAIA.
4. MAIA stores the submitted records against the relevant customer or activity record.
5. Management can refer to the submitted records for visibility and follow-up.
6. This function is for activity record keeping only and does not independently verify that a physical customer visit took place.

8. Implementation Approach

8.1 Implementation Stages

Implementation is expected to proceed in the following order:

1. Kickoff and workflow confirmation
2. Navision data and integration approach confirmation
3. Logic and configuration design
4. System setup
5. Integration setup, if Option 2 is selected
6. User acceptance testing
7. Training
8. Go-live support

8.2 What Mindhive Will Do

Mindhive will:

- confirm the agreed workflow design
- review the current inquiry, quotation, sales order, invoice, warehouse, and delivery flow
- confirm whether Phase 1 will proceed with exported Navision data or direct Navision integration
- configure the agreed business rules
- set up required customer, item, pricing, and workflow references
- support setup based on exported customer and price list data if Option 1 is selected
- implement direct Navision integration if Option 2 is selected and commercially agreed
- support testing and issue clarification
- conduct training for agreed users

- support rollout for the agreed Phase 1 scope
- identify which advanced requirements should be treated as customization

8.3 What Industrial Automation Will Need to Provide

Industrial Automation will need to provide:

- relevant Navision access or vendor coordination if direct integration is selected
- exported customer list if Option 1 is selected
- exported customer-specific price list if Option 1 is selected
- item and SKU references, if required
- sample quotations, sales orders, invoices, and related documents
- approval rules for quotation, discounts, pricing exceptions, and credit limit exceeded scenarios
- user and role structure for approval routing
- sales activity tracking requirements for location, document, and photo submission
- internal PICs for review and sign-off
- UAT users and timely feedback during testing
- customer creation and customer profile update approval rules, if required
- list of users who are allowed to create or update customer profiles
- agreed update frequency for exported Navision data if Option 1 is selected
- confirmation of which document types are included in Phase 1

This is important to ensure the project moves smoothly and expectations remain aligned.

9. Timeline

9.1 Indicative Timeline

Phase	Scope	Estimated Timeline
Phase 1	Core internal WhatsApp sales and order assistant. Includes request intake, quotation or sales order draft preparation, customer and item reference, pricing check, stock check, credit and overdue payment check, standard quotation visibility, document support, backend visibility, activity trail, document trail, user training, UAT, and go-live support.	3 to 4 weeks
Customizations	Approval flows and sales activity tracking, if confirmed for Phase 1.	Included in the Phase 1 rollout timeline, subject to approval matrix and sales activity tracking requirement confirmation

9.2 Timeline Notes

Timeline may vary depending on:

- selected integration option
- access to Navision or its database environment
- availability of Navision vendor support
- turnaround time for exported customer and price list data
- complexity of approval rules
- quality of customer, item, and pricing data
- speed of internal review and feedback
- depth of client-specific customization required
- timing of the future ERP change to Microsoft Dynamics or another system

10. Commercials

10.1 One-Time Implementation Fee

Category	Scope	What it covers	One-time fee
B2B MAIA Phase 1	Internal WhatsApp Sales and Order Assistant	WhatsApp request intake, quotation or sales order draft preparation, customer and item reference, pricing check, stock check, credit and overdue payment check, document support, backend visibility, activity trail, document trail, training, UAT, and go-live support	RM20,000
Customization	Approval flows	Approval flow for quotation-level approval, discounts applied, pricing rule exceptions, credit limit exceeded scenarios, and customer creation or profile update approval where required	RM3,000, waived FOC
Customization	Sales activity tracking	Salespeople can submit location, documents, and photos to MAIA for activity record keeping and management visibility	RM3,000
Discount	Special signing discount if signed by 21 May 2026	Additional commercial discount offered if Industrial Automation signs this proposal by 21 May 2026	RM5,000 discount
Total payable if signed by 21 May 2026	Phase 1 implementation, approval flows waived FOC, sales activity tracking, and special signing discount applied	One-time payable amount after waived approval flow customization and signing discount	RM18,000

10.2 Customization Pricing

Category	Scope	What it covers	Commercial Treatment
Customization	Approval flows	Approval flow for quotation-level approval, discounts applied, pricing rule exceptions, credit limit exceeded scenarios, and customer creation or customer profile update approval where required	RM3,000, waived FOC for this Phase 1 rollout
Customization	Sales activity tracking	Salespeople can submit location, documents, and photos to MAIA for activity record keeping and management visibility	RM3,000
Not treated as customization	Quotation conversion visibility	MAIA can already filter quotations by date and show open quotations that have not yet been generated into Sales Orders	Included in standard usage

10.3 Integration Options

Option	What it covers	Commercial Treatment
Option 1: No direct Navision integration first	Industrial Automation exports required references from Navision. MAIA uses the exported customer and price list data for initial setup. ERP integration can be done later when the new ERP is ready.	No immediate Navision integration fee. Future ERP integration to be scoped separately.
Option 2: Integrate with Navision now	MAIA connects with Navision now based on agreed document types, data fields, and sync requirements. If Industrial Automation later changes ERP, a second integration will be required.	RM5,000 to RM10,000, depending on document types and complexity. Future ERP integration to be scoped separately.

10.4 Monthly Subscription

Industrial Automation processes approximately 1,350 orders per month.

Based on the proposed commercial arrangement, the monthly subscription for MAIA is:

Monthly Order Volume	Monthly Fee
Up to 2,000 successful orders per month	RM2,000/month

10.5 What the Monthly Subscription Covers

The monthly subscription covers:

- MAIA platform access
- ongoing system usage for the agreed scope
- standard support for the agreed scope
- bug fixes within the agreed scope
- standard operational maintenance for the subscribed setup

Any third-party charges, WhatsApp Business API charges, Navision vendor charges, external system charges, and client-specific infrastructure or hosting requirements are excluded unless separately agreed in writing.

10.6 Payment Terms

The total one-time payable amount is RM18,000, after applying the RM5,000 special signing discount.

This RM5,000 discount is only applicable if Industrial Automation signs this proposal by 21 May 2026. If the proposal is signed after 21 May 2026, the discount will no longer apply and the one-time payable amount will revert to RM23,000.

Milestone	Percent age	Amount	Payment Trigger
Upfront Payment	50%	RM9,000	Upon project commencement
Completion of UAT	50%	RM9,000	Upon completion of UAT
Total	100%	RM18,000	After RM5,000 signing discount, applicable only if signed by 21 May 2026

The monthly subscription of RM2,000/month will start from the go-live date after completion of UAT. The subscription covers up to 2,000 successful orders per month.

10.7 Commercial Notes

This proposal assumes:

- the base Phase 1 implementation fee is RM20,000
- approval flow customization is priced at RM3,000 and waived as FOC for this Phase 1 rollout, subject to final approval matrix confirmation
- sales activity tracking customization is priced at RM3,000
- a special RM5,000 signing discount applies if Industrial Automation signs this proposal by 21 May 2026
- the total one-time payable amount after the waived approval flow customization and signing discount is RM18,000
- if Industrial Automation signs after 21 May 2026, the RM5,000 signing discount will no longer apply and the one-time payable amount will revert to RM23,000
- the monthly subscription is RM2,000/month and covers up to 2,000 successful orders per month
- third-party fees, client-side hosting, infrastructure, WhatsApp Business API charges, Navision vendor charges, and external system charges are excluded unless specifically agreed in writing
- Navision vendor support, if required, may be charged separately by the vendor
- direct Navision integration is excluded unless Option 2 is selected and commercially agreed
- future ERP or Microsoft Dynamics integration will be scoped and charged separately
- quotation conversion visibility is included in standard usage because MAIA can already filter open quotations by date
- final technical scope remains subject to kickoff confirmation and agreed access to required references

11. Assumptions and Exclusions

11.1 Assumptions

This proposal assumes that:

- MAIA will sit on top of Navision and will not replace Navision
- Industrial Automation processes approximately 1,350 orders per month

- the monthly subscription of RM2,000/month covers up to 2,000 successful orders per month
- Industrial Automation may change from Navision to a new ERP system such as Microsoft Dynamics in the future
- the agreed workflows can be clearly documented during kickoff
- required customer, item, pricing, stock, credit, and approval references will be provided by Industrial Automation
- if Industrial Automation chooses not to integrate with Navision in Phase 1, the client will provide exported customer list and price list data from Navision for MAIA setup
- if Industrial Automation chooses to integrate with Navision now, the integration cost is estimated at RM5,000 to RM10,000, depending on document types and technical complexity
- if Industrial Automation changes ERP later, integration with the new ERP will be scoped and charged separately
- ambiguous or edge-case scenarios may still require human confirmation unless specifically customized
- implementation progress depends partly on the availability of client-side reviewers and vendor responsiveness
- customer creation and customer profile update restrictions will be configured based on the agreed user roles and approval matrix
- sales activity tracking is for submitted activity record keeping and does not independently verify physical customer visits
- if Option 1 is selected, stock, credit, overdue, pricing, and customer information accuracy depends on the exported data provided by Industrial Automation and the agreed update frequency
- client-side hosting and infrastructure are excluded unless separately agreed in writing

11.2 Exclusions

Unless otherwise stated, this proposal does not include:

- full ERP replacement
- major restructuring of Navision
- major restructuring of the client's accounting or inventory system
- customer-facing chatbot workflows
- B2C-facing workflows
- direct Navision integration unless Option 2 is selected and commercially agreed

- future ERP or Microsoft Dynamics integration unless separately scoped and commercially agreed
- any second integration after Industrial Automation changes ERP
- manual data export from Navision, which remains the client's responsibility if Option 1 is selected
- advanced dashboards or reports beyond agreed standard visibility
- branch or regional reporting unless specifically scoped
- service scheduling or Gantt chart unless specifically scoped
- physical salesperson visit verification, GPS attendance tracking, or proof that a salesperson visited a customer, unless separately scoped
- client-side hosting, infrastructure, server management, or cloud environment management unless separately agreed in writing
- live Navision push/pull sync if Option 1 is selected
- quotation conversion ratio dashboard by salesperson, region, month, quotation value, or team performance unless separately scoped
- third-party implementation work outside Mindhive's agreed scope
- additional customizations not listed in this proposal
- external vendor fees, WhatsApp API fees, or infrastructure charges unless specifically stated

12. Success Criteria for Phase 1

Phase 1 will be considered successfully delivered when:

- the agreed internal WhatsApp workflow is configured and available for use
- the agreed users are trained
- agreed customer, item, pricing, stock, and credit references are available within the workflow
- the agreed approval guardrails are functioning as intended, if approval flow customization is confirmed
- sales activity tracking is functioning as intended, if confirmed in scope
- the agreed document flows are functioning as intended
- standard quotation filtering by date and open quotation visibility are available
- the agreed backend visibility features are live
- activity trail and document trail are available for agreed workflows
- agreed test cases pass during UAT

- the client signs off on the agreed rollout scope

This helps both parties stay aligned on what “done” means.

13. Recommended Next Steps

To proceed, we recommend the following next steps:

1. Confirm acceptance of the proposed Phase 1 direction.
2. Confirm whether Phase 1 will proceed with Option 1 or Option 2 for Navision integration.
3. Confirm the approval flow requirements and approval matrix.
4. Confirm whether sales activity tracking should be included in Phase 1.
5. Confirm the Phase 1 commercial package.
6. Confirm the monthly subscription based on expected order volume.
7. Appoint implementation PICs from both sides.
8. Schedule kickoff workshop.
9. Begin customer list, price list, document, rule, and workflow confirmation.
10. Proceed with system setup, UAT, training, and go-live preparation.

14. Proposal Validity

This special commercial arrangement is valid until **21 May 2026**. To proceed under the **RM5,000 signing discount** and revised monthly subscription arrangement, Industrial Automation should confirm acceptance and sign this proposal on or before this date.

If the proposal is signed after **21 May 2026**, the RM5,000 signing discount will no longer apply and the one-time payable amount will revert to **RM23,000**.

15. Acceptance of Proposal

By signing below, both parties acknowledge that they have reviewed and accepted the scope, commercials, assumptions, exclusions, implementation approach, and proposal validity terms described in this proposal.
