

# Holsen v2 Prep work for Product & Dev

## Feature: C1 Certificate – Reuse on repeat orders (Customer + Item)

### User story:

1. As a Sales user, I want to attach a customer's C1 certificate to a specific customer + item (or HS-code/description) combination, so we don't need to re-request C1 on every repeat order.
  - a. C1 is used repeatedly once validated, and stays valid until it is superseded.
  - b. C1 has no quantity tracking requirement on Holsen side; the client manages any limits themselves.
2. As a Sales user, I want MAIA to automatically suggest/apply the correct C1 when creating a new SO that contains an item covered by an active C1 for that customer, so tax-exempt orders are created consistently.
  - a. Holsen is a manufacturer and sells tax-free when the customer provides a valid C1, so reuse needs to be simple and consistent.
3. As a Finance user, I want the C1 exemption number to appear on the invoice (e.g., in remarks), so we have an audit trail proving why the sale is tax-exempt.
  - a. Holsen's current practice is to record the exemption number on invoices as proof.

### Acceptance criteria:

1. C1 record model supports reuse.
  - a. MAIA allows storing a C1 certificate at customer level and linking it to covered items (by item/SKU and/or HS code + description).
  - b. Each stored C1 has a status (Active / Superseded / Expired/Inactive) and supports uploading the certificate file as attachment.
2. C1 auto-suggestion / auto-apply on SO.
  - a. When a user creates an SO for a customer, MAIA checks SO line items and suggests/applies the Active C1 for any covered item.
  - b. If no active C1 exists for that customer + item, MAIA does not apply C1 and clearly indicates "C1 missing / not active" for that line or order.
3. Superseded handling (no re-request every time).
  - a. When a new C1 is uploaded for the same customer (superseding the previous), the old C1 can be marked Superseded and MAIA uses the new C1 for future SOs.

4. No quantity tracking for C1.
  - a. MAIA does not track remaining quantity/volume for C1 and does not block orders based on C1 balance.
5. Invoice audit trail.
  - a. For orders where C1 is applied, the invoice output includes the C1 exemption/certificate number in the invoice remarks (or equivalent field) for audit proof.

## Feature: C3 tax exemption (single-order, quantity-based, import on behalf)

### User story:

1. As a Sales/Admin user, I want to create a C3 record per SO and attach the required documents, so each C3 order is complete and auditable.
  - a. Scenario: New C3 order creation
    - i. customer provides PO + appointment letter,
    - ii. Holsen generates C3 in SST portal, and checks PO quantity matches SST application before submitting.
2. As a Logistic user, I want to receive C3 shipment stock and split it into correct internal allocations (by lot/batch), so we only deliver to the customers covered by those C3s.
  - a. Scenario: 1 container, 4 C3s
    - i. 20 metric tons imported under 4 C3 certificates (5 tons per customer)
    - ii. Stock must be split into 4 allocations and cannot be sold to other customers.
  - b. Scenario: Multiple lots in one container
    - i. Shipment arrives as several manufacturer lot numbers (e.g., 7t + 8t + 5t)
    - ii. Each lot is labeled and tracked, and allocations still map to the right C3/customer
3. As a Sales user, I want the system to keep stock usage strictly per C3 order, so urgent orders do not “borrow” stock from another C3 order.
  - a. Scenario: SO1 vs SO2
    - i. SO1 is delivered over months,
    - ii. SO2 is urgent; SO2 cannot use SO1’ s C3 stock,
    - iii. any change must be manually agreed and handled as rescheduling (not mixing).
4. As a Sales user, I want MAIA to track C3 balance and block overselling, so deliveries never exceed the C3 approved quantity.

- a. Scenario: Multi-delivery C3
  - i. one C3 can be fulfilled in many deliveries/invoices,
  - ii. but total delivered must not exceed approved quantity.
- 5. As a Finance/Admin user, I want the C3 exemption number captured and printed on the invoice (current practice: invoice remarks), so we can prove tax exemption during audit.
  - a. Scenario: “Pure C3 documents”
    - i. C3 shipments are typically separated into their own DN/SI
    - ii. the customer can match PO + cert easily.

## Acceptance criteria:

- 1. C3 order setup
  - a. MAIA allows creating one C3 per SO and storing:
    - i. C3 cert number,
    - ii. customer,
    - iii. item(s),
    - iv. approved quantity
    - v. status (Draft/Active/Closed).
  - b. MAIA supports attaching:
    - i. PO,
    - ii. appointment letter
    - iii. C3 certificate to the SO/C3 record.
- 2. Quantity validation + control
  - a. MAIA requires an approved quantity for C3 and tracks delivered quantity; remaining balance is shown on the SO/C3.
  - b. MAIA blocks delivery/invoicing that would exceed the approved quantity.
- 3. No mixing rules (hard rule)
  - a. MAIA prevents allocating C3 stock to a different customer or a different C3/SO.
  - b. MAIA prevents “borrowing” stock between SO1 and SO2 even if item is the same.
- 4. Shipment allocation + lot/batch tracking
  - a. On stock entry, MAIA
    - i. stores manufacturer lot number

- ii. supports splitting quantity into multiple internal batches/allocations linked to specific C3s/customers.
- b. MAIA supports:
  - i. one lot → multiple internal allocations (if needed)
  - ii. one shipment → multiple lots → multiple batches.
- 5. Import document trail
  - a. MAIA allows attaching K1 and COA (and general import docs like supplier invoice, packing list, BOL) at stock entry/batch level
  - b. K1 can store the C3 exemption number reference.
- 6. Audit support
  - a. MAIA provides a movement view per C3/stock entry (incoming vs outgoing) to support SST audits and periodic reconciliation (Holsen currently updates Jados C02 every 3 months).
- 7. Invoice reference
  - a. When C3 is applied, MAIA prints the C3 exemption number on the invoice (e.g., remarks), aligned with Holsen's current practice

## Feature: Batch & lot tracking for C3 compliance

### User story:

1. As a logistics user, I want MAIA to treat each manufacturer lot number as a batch (by default), so shipment stock is traceable and easy to allocate.
  - a. One shipment can have multiple manufacturer lot numbers, so MAIA must support multiple batches per shipment/stock entry.
  - b. Each batch stores: product, manufacturer lot number, received quantity, and linked exemption/import documents.
  - c. Batch-level document pack (typically attached together for import):
    - d. K1 form(s)
    - e. COA (full/masked if applicable)
    - f. Bill of Lading (B/L)
    - g. supplier/vendor invoice
    - h. packing list.

2. As a Admin user, I want MAIA to enforce “C3 stock belongs to the client” , so stock imported under C3 cannot be sold to other customers.
  - a. Scenario: 20t container split into 4 C3 clients (5t each)
    - i. all 20t can only be delivered to those 4 clients, never to anyone else.
  - b. Scenario: Shipment has lots A/B/C (e.g., 7t + 8t + 5t),
    - i. warehouse labels must match MAIA batches
    - ii. each lot/batch must still be allocated only to the correct C3 clients.
3. As a Sales user, I want MAIA to allocate and consume stock by C3 order, so we never mix allocations across different C3 orders (even for the same item).
  - a. Scenario: SO1 vs SO2
    - i. SO2 cannot use SO1 allocation
    - ii. any change is done by manual agreement and rescheduling, not silent stock reallocation.
4. As a logistics user, I want batch creation to work both ways (post-arrival or pre-created), so we can match current practice but still support future workflow.
  - a. Current practice: create batches after stock arrives, then allocate to customers.
  - b. Optional: pre-create batch numbers before arrival (0 quantity), then receive into the batch when shipment lands.

## Acceptance criteria:

1. Lot vs batch rules
  - a. MAIA supports multiple manufacturer lot numbers under one shipment/stock entry and creates one batch per lot by default.
  - b. Each batch must store:
    - i. manufacturer lot number,
    - ii. product,
    - iii. total/received quantity
    - iv. batch-level attachments.
2. Document attachment scope (K1 pack)
  - a. MAIA allows attaching at stock entry/batch level:
    - i. K1 form(s),
    - ii. COA,
    - iii. Bill of Lading,

- iv. supplier/vendor invoice, packing list.
  - v. MAIA supports multiple K1 documents for one shipment when a container is split across multiple C3 customers (e.g., 4 K1 for 4 clients).
- 3. Document linking (traceability chain)
  - a. MAIA supports linking the compliance chain: C3 → PO + appointment letter → K1 → batch → SO → DN → SI → customer.
  - b. K1 record/attachment can store or reference the C3 exemption number (cert number) so it is searchable in audit.
- 4. Stock allocation rules (hard rules)
  - a. MAIA blocks allocating C3 batches to any customer without the matching C3 exemption.
  - b. MAIA blocks mixing stock between different C3 orders (SO1 allocation cannot be used for SO2).
- 5. Allocation patterns supported
  - a. MAIA supports:
    - i. one container → multiple C3 clients (split allocations)
    - ii. one container → multiple lots → multiple batches → allocations to the correct C3 clients.
- 6. Batch timing
  - a. MAIA supports both:
    - i. create batch after arrival
    - ii. pre-create batch with 0 quantity then receive later.
- 7. Transaction visibility
  - a. MAIA shows batch-level movements (received, allocated, delivered) so SST audit questions like “where is the stock?” can be answered from the system.

## Feature: UBS integration (no CSV) – eInvoice PDF upload + MAIA invoice override

### User story

1. As an Admin user, I want to upload the UBS eInvoice PDF into the matching MAIA Sales Invoice (SI), so MAIA can reflect a complete order lifecycle even when the invoice is issued from UBS.
  - a. UBS remains the source of the legally compliant eInvoice (with eInvoice ID/fields).
  - b. MAIA’s own SI PDF is not treated as the official eInvoice document.

2. As a Sales user, I want to fetch the invoice from MAIA and get the UBS eInvoice PDF by default, so I always send customers the correct compliant document.
  - a. The default returned PDF should be the uploaded UBS file when it exists.
  - b. MAIA's native SI PDF can still exist, but it should not be the default when UBS PDF is available.
3. As an Management user, I want MAIA reporting and order tracking to remain accurate, so an order does not look "unfinished" just because invoicing happens in UBS.
  - a. Without the upload, MAIA billing stage would look empty and lifecycle metrics break.
  - b. With the upload, MAIA can show that the sale/order is completed.
4. As a Project team, I want to avoid building UBS CSV integration for invoices/DO, so we don't spend effort on UBS "setup data" constraints that will be replaced by the SQL migration.
  - a. UBS CSV imports have many system-restricted fields (dropdown-like allowed values) that are hard to maintain and prone to failure.
  - b. Holsen decided it's too much hassle and prefers to keep UBS invoicing as-is until SQL.

## Acceptance criteria

5. MAIA SI record supports attaching an "Official UBS eInvoice PDF" file.
  - a. The attachment is stored against the correct SI
  - b. can be replaced with a newer version if needed (latest file is the official one).
  - c. The system clearly indicates the SI has an official UBS eInvoice PDF attached.
6. When a user views/downloads the invoice from MAIA, MAIA returns the UBS eInvoice PDF by default when it exists.
  - a. If no UBS PDF is uploaded, MAIA may fall back to its native SI PDF.
  - b. The UBS PDF override behavior mirrors the long-term "third-party PDF overrides native PDF" approach discussed for SQL integration.
7. Uploading the UBS eInvoice PDF updates MAIA's order lifecycle completeness (billing stage no longer appears empty).
  - a. MAIA metrics/status should treat the SI as completed once the UBS PDF is attached.
  - b. exact status naming up to product, but outcome must be visible.
8. This feature does not require UBS CSV export/import for Invoice or DO as part of the scope.
  - a. The workflow remains: MAIA runs SO/DN operations
  - b. UBS generates DO (required before invoicing)
  - c. generates the compliant eInvoice

- d. MAIA stores the UBS PDF for tracking and retrieval.

## **Feature: PSO & Poison Handling – PSO issuance with DN (current) + PSO auto-generation (future)**

### **User story:**

1. As a Logistics/Ops user, I want to include a PSO form together with the DN when delivering poison SKUs, so the customer can sign to acknowledge receipt and we can keep the signed copy for compliance.
  - a. This applies when the delivery contains poison items; non-poison deliveries do not need PSO.
  - b. The PSO is used as proof for Poison License B compliance, and Holsen keeps the copy for FARMASI/KKM checks.
2. As a Logistics/Ops user, I want MAIA to help reduce delays caused by manual PSO preparation, so the logistics team doesn't need to wait for another team to prepare the PSO document.
  - a. Today the PSO is prepared manually; the pain is the waiting/coordination, not complexity.
3. As an Admin/Compliance user, I want each SKU to be clearly marked as poison vs non-poison, so PSO handling is consistent and not dependent on staff memory.

### **Acceptance criteria:**

1. PSO inclusion with DN (current operating requirement)
  - a. For any delivery that includes poison SKUs, the PSO document must be provided to the customer together with the DN for signature, and Holsen retains the signed PSO copy.
  - b. If a DN contains both poison and non-poison lines, the PSO should cover only the poison items (example discussed: nickel + boric acid, PSO includes boric acid only).
  - c. MAIA supports flagging SKUs as poison/non-poison so the team can identify when PSO is required.
2. PSO auto-generation (future automation scope, not mandatory day-1)
  - a. When generating a DN, if at least one DN line is a poison SKU, MAIA can automatically generate a PSO document populated with DN/customer details and listing only poison lines.
  - b. The PSO can be attached as an appendix to the DN printout pack so DN + PSO can be printed together in A4 format.
  - c. If no poison SKU exists in the DN, MAIA does not generate PSO.

# Feature: Stock ledger & SST audit compliance (C3 exempt goods)

## User story:

1. As a Compliance/Admin user, I want the system to keep a stock ledger for C3 exempt goods, so I can reconcile incoming vs outgoing quantities and answer SST audits.
  - a. Include the existing “Jados C02” style tracking (incoming, outgoing, balance).
  - b. Support the current 3-monthly update cycle (every three months).
2. As a Dispatch user, I want the system to show and enforce the correct customer allocation for exempt stock, so I don't deliver to an unauthorized customer by mistake.
  - a. Prevent mixing allocations across different C3 orders (SO1 stock cannot be used for SO2).
3. As a Sales/Fulfillment user, I want the system to support staggered deliveries for the same C3 order, so we can deliver over multiple DNs/SIs while keeping the remaining balance accurate.

## Acceptance criteria:

1. Stock ledger and reconciliation
  - a. System records incoming exempt stock (by stock entry/batch) and outgoing deliveries (by DN/SI) and shows current balance.
  - b. System can export a report for a selected date range (minimum: quarterly / 3 months) that matches the “Jados C02” reconciliation needs.
  - c. For any exempt shipment/batch, system can show “still in stock” vs “already delivered” , with quantities.
2. Audit traceability
  - a. For an SST audit question like “where is the stock?” , system can show the full movement trail (received → allocated → delivered) and the authorized customer(s).
  - b. System can filter by customer, item, batch/lot, and C3/PO reference to retrieve supporting records quickly.
3. Dispatch allocation control
  - a. When dispatch creates/prints/confirms a DN, system validates that the selected batch is allocated to that customer and blocks confirmation if not allowed.
  - b. System prevents fulfilling a C3 order using stock allocated to a different C3 order, unless a recorded manual override is performed (with reason).
4. Staggered delivery handling
  - a. System allows multiple deliveries/invoices against the same C3 allocation and keeps an accurate “remaining quantity” balance.

- b. System blocks over-delivery beyond the approved/allocated exempt quantity.

## Feature: Other Hazardous Handling Requirements (Lower Priority)

### User story:

1. As a Logistic user, I want MAIA to optionally store hazardous handling metadata (e.g., UN number, hazard class, weight/handling notes) on SKUs, so we can support more sophisticated handling requirements in the future without redesigning the SKU master.
  - a. This is lower priority for Holsen currently because the team is not very particular about UN code / hazard class / weight handling now.
  - b. This becomes more relevant for sophisticated importers, where such metadata is expected to be tracked.
2. As a Logistics user, I want to keep transport compliance work with external transporters, so MAIA doesn't need to enforce external labeling or cold chain controls at this stage.
  - a. Holsen currently engages external transporters, so external labeling/transport handling is generally managed outside Holsen's internal workflow.
  - b. Enforcement is mainly by other agencies (the meeting example mentioned JPJ for transport-related regulation), so it's not the immediate system focus.

### Acceptance criteria:

3. Data capture (optional / future-ready)
  - a. MAIA supports optional SKU fields for UN number, hazard class, and handling notes (including weight-based handling notes) without affecting current order/DN flow.
  - b. These fields can be left blank for most SKUs without blocking transactions.
4. Non-enforcement (current scope)
  - a. MAIA does not block SO/DN creation based on missing UN/hazard/handling fields.
  - b. MAIA does not require transport labeling/cold chain workflows to be completed inside MAIA, since logistics is outsourced and this is not prioritized now.
5. Future extensibility (later phase)
  - a. MAIA can later surface these fields onto DN/attachments or compliance reports if Holsen decides to support importer-grade handling requirements.

## Feature: Document Attachment Tagging & Document Pack Management

## User story:

1. As a Logistics/Inventory user, I want to upload and tag key documents to the correct stock entry and batch, so each batch has a complete document pack for audit and daily reference.
2. As an Admin user, I want to view and download all documents attached to a batch in one place, so I can quickly prepare audit packages or answer compliance queries.
3. As a logistic user, I want to see which documents are missing from a batch, so I can follow up with suppliers or internal teams before shipment or delivery.

## Acceptance criteria:

1. Document type tagging
  - a. System has a "Document type" field with predefined types:
    - Stock entry/batch: K1, COA (full/masked), Supplier Invoice, Packing List, Bill of Lading (B/L)
    - Order/Sl: C1, C3, Appointment Letter
    - DN: PSO, Signed PSO Copy
  - b. Users can select document type when uploading attachment.
  - c. Document type is displayed alongside attachment name in all views.
2. Correct attachment location enforcement
  - a. System enforces attachment location rules:
    - Stock entry/batch: K1, COA, B/L, Supplier Invoice, Packing List
    - Order/Sl: C1, C3, Appointment Letters
    - DN: PSO and signed PSO copy
  - b. System prevents attaching wrong document type to wrong entity (e.g., cannot attach PSO to stock entry).
3. Multiple documents of same type
  - a. System allows uploading multiple documents of the same type (e.g., 4 K1 forms for one shipment split to 4 customers).
  - b. Each document has distinct metadata (upload date, uploader,

file size, version if replaced).

#### 4. Document pack view

- a. Batch detail page shows a "Document Pack" section listing all attached documents grouped by type.
- b. Users can view/download individual documents or bulk download all documents.
- c. Missing mandatory documents are flagged with visual indicator (e.g., "K1: Missing" in red).

#### 5. Document linking & traceability (already covered in Batch feature)

- a. K1 attachment can store/reference the C3 exemption number for searchability.
- b. System maintains traceability chain:  
C3 → PO + Appointment Letter → K1 → Batch → SO → DN → SI → Customer.

## Feature (Future / Phaseable): Document Data Extraction (OCR + validation fields)

### User story:

- As a Admin user, I want the system to extract key fields from uploaded documents, so we can reduce manual typing and improve reporting accuracy.
  - Extract fields such as K1 number, dates, quantities, supplier; supplier invoice number/date; COA lot number and product; packing list; BOL references.

### Acceptance criteria:

- Phaseable implementation
  - This feature is marked as future/phaseable and does not block day-1 go-live.
- Extraction storage
  - System stores extracted fields as document metadata linked back to the original attachment and batch/stock entry.
- Search + reporting ready
  - Extracted fields are searchable and can be used later to support SST/Jados C02-style reporting outputs.

- Manual override
  - User can correct extracted values when OCR confidence is low (extraction should not hard-block operations by default).

## Feature good to have

### Feature: UBS CSV integration (optional) – Sales Order (SO) export for paper trail

#### User story

1. As a Sales/Admin user, I want to export a confirmed MAIA Sales Order (SO) into a UBS CSV format, so the UBS user can import it as a reference record and reduce re-keying when preparing the UBS DO and UBS eInvoice.
  - a. UBS does not require an SO to issue invoice;
  - b. SO in UBS would help as a reference for the UBS operator.
  - c. The UBS SO serves mainly as a “paper trail” so UBS DO and UBS invoice can tally back to the SO record.

#### Acceptance criteria

2. MAIA can generate/download a UBS-compatible SO CSV file for a confirmed SO.
  - a. The export uses the UBS raw master data naming (customer name/ID, SKU naming) to avoid mismatch during import.
  - b. If customer/SKU does not exist in UBS (or does not match UBS naming), MAIA must prevent export or clearly flag the mapping issue, because the import will fail or create reconciliation gaps.
3. This SO export feature is separate from invoice/DO CSV automation (which was dropped due to setup-data hassle).
  - a. UBS invoice remains created manually in UBS and the UBS eInvoice PDF is uploaded back into MAIA for lifecycle tracking

## Product side – what to define and design

- Specify supported tax exemption types
  - Support C1 and C3 fully;

- document A57 only as “future support, not in current scope for Holsen” .
- Define C1 behaviour in MAIA
  - Enable the storage of client C1 linked to a specific customer and item, allowing it to be reused for future orders unless replaced.
  - State clearly that C1 quantity limits (if any) are client’ s responsibility, not tracked by Holsen.
  - Keep C1 reference visible in invoice remarks, not on DO.
- Define C3 order and quantity rules
  - For each C3, define total approved quantity (e.g., 100t)
  - allow split delivery (20t × 5).
  - Require that C3 stock for one order cannot be used to fulfill another order / C3 (e.g., SO1 100t vs SO2 50t).
  - Clarify that any change (bringing forward or rescheduling) is a manual agreement with the customer, not auto-reallocation.
  - For C3, prefer standalone DN/SI with only exempted items to keep audit trail simple.
- Decide how exemption references are shown
  - Business rule: system tracks exemptions per item line, but documents for Holsen currently show:
    - SI: exemption number in remarks only.
    - DO: no exemption reference.
  - Product to confirm this is acceptable and document as current standard.
- Define lot vs batch behaviour and stock allocation rules
  - One shipment can contain several manufacturer lot numbers; each lot typically becomes a batch in MAIA.
  - Batch carries lot number, quantity, product, and linked exemption docs :
    - K1 forms
    - C3 exemption certificates
    - Client C1 certificates (where applicable)
    - Certificates of Analysis (COA – full and masked)
    - Supplier invoices (supply/vendor invoices)
    - Packing lists
    - Bill of Lading (BOL)

- Related POs and appointment letters (as needed for traceability)
- For C3 imports (e.g., 20t container split to 4 clients), clearly state that:
  - All 20t can only be sold to those 4 C3 clients.
  - No stock is allowed to be sold to other customers.
- Define poison handling process
  - Each SKU must be marked poison or non-poison.
  - Any DN with poison items must have a PSO (Poison Signback Order) generated.
  - PSO lists only poison items from that DN and is required under Poison License B (FARMASI KKM).
  - Customer signs PSO; Holsen keeps the copy for audits.
- Clarify document expectations and priorities for extraction
  - Confirm which attachments are mandatory in the system and at what level:
    - Stock entry / batch: K1, COA (full & masked), BOL, Supplier Invoice, Packing List.
    - Order/invoice: C1, C3, appointment letters, PSO.
  - Prioritise which documents need field extraction (vs just storage):
    - K1, C3, COA, Supplier invoices, Packing lists, possibly BOL for SST reporting.
  - Clarify business goal: extracted fields should help auto-fill SST/Jados C02 and reduce manual Excel work.
- Define document flow between MAIA and UBS/SQL
  - SO and DN are created in MAIA; UBS is used only for official e-invoices.
  - SI in MAIA is the operational record; UBS e-invoice PDF is the legal document attached back to the SI.
  - Confirm that SI and DN do not need UBS-format exports; only SO→UBS CSV may be required in the interim.

## Tech / Dev side – what to implement

1. Extend data model for exemptions, batches, and poison flows
  - Create entities for Exemption (C1, C3, future A57) linked to customers, items, and orders.
  - Ensure batch stores manufacturer lot number, quantity, product, and links to K1, COA, etc.
  - Add poison flag on SKU and a PSO entity linked to DN and poison lines.
1. Implement C3 enforcement logic (High priority)
  - Track remaining quantity for each C3 (total approved minus shipped).

- Prevent:
  - Overselling beyond C3 quantity.
  - Allocating C3 stock to a different customer/order/C3.
- Support multi-delivery scenarios for one C3 (e.g., 20t × 5) and ensure traceability.

## 2. Implement exemption mapping and printing rules (High priority)

- Store exemption references per item line on SO, DN, SI for internal logic.
- Configure print templates so that:
  - SI shows exemption reference in invoice remarks (current Holsen style).
  - DO omits exemption references.

## 3. Implement attachment tagging and placement (Medium priority)

- Build a document type field (K1, COA, BOL, Supplier Invoice, Packing List, PSO, C1, C3, etc.).
- Enforce attachment location:
  - Stock entry/batch:
    - K1
    - COA
    - BOL
    - Supplier Invoice
    - Packing List
  - Order/SI:
    - C1
    - C3
    - appointment letters
  - DN: PSO (and signed copy).

## 4. Implement PSO automation (Low priority)

- On DN creation, if any line has `poison = true`, auto-generate a PSO record and PDF:
  - Include only poison line items, with quantities and delivery details.
- Allow upload of signed PSO and link it to the same DN/PSO record.

## 5. Build extraction framework (phaseable) (Medium priority)

- Create a pipeline to ingest attachments and run OCR extraction for:
  - K1: number, linked C3 number, dates, quantities, supplier.
  - C3: certificate number, HS code, item description, buyer.
  - COA: lot number, product, manufacturer, key metadata.
  - Supplier Invoice: number, date, supplier, values.
  - Packing List/BOL: reference numbers, dates, quantities, weights.
- Define storage for extracted fields (e.g., on batch, stock entry, or a document metadata table).
- Integrate extracted data into reporting (e.g., to generate Jados C02-like outputs).

## 6. Handle integration constraints with UBS and future SQL

- While UBS is in use:
  - Block creation of new customers/SKUs in MAIA that don't exist in UBS.
  - Support SO → UBS CSV export respecting UBS dropdown/value constraints.
  - Support manual upload of UBS e-invoice PDFs back into MAIA SI and set them as the “primary” invoice document.
- For SQL with API:
  - Implement sync: pull master data from SQL, push new customers/items from MAIA to SQL, store external IDs.
  - Plan for direct order/invoice/inventory posting to SQL (no CSV) in later phase.
