

Ladang YS Customer Narrative Document

1. Purpose of This Document

This document provides the product and implementation team with the client context needed to take over Ladang YS after sales handover.

It combines:

- Ladang YS’ s current operating process
- The confirmed Phase 1 MAIA scope
- Setup items included in the proposal
- Commercial terms stated in the proposal
- Key boundaries and matters that require confirmation during kickoff
- Potential future Phase 2 opportunities that must not be assumed as current scope

Important clarification: Ladang YS uses **SQL Accounting**. Product team should treat SQL Accounting as the existing accounting and document reference system for this project. MAIA is intended to sit on top of SQL Accounting, not replace it.

2. Client Snapshot

Item	Details
Client	Ladang YS
Business Type	Coconut product supplier
Customer Types	F&B businesses and selected hypermarts
Main Order Channels	WhatsApp and downloaded PO documents from selected hypermart B2B portals
Confirmed Operational Volume	Approximately 100 orders, PO, or invoices per week
Existing System	SQL Accounting
Current Working Tool	Google Sheets for daily manual order compilation
Primary Operational Issue	Messy incoming orders, repeated manual key-in, high owner dependency, and limited visibility

Proposed MAIA Role	Internal WhatsApp-based order processing and operational control layer
Signed Commercial Package in Uploaded Proposal	MAIA Lite, FOC implementation fee, RM1,000/month for up to 600 successful orders/month, 3-month minimum commitment, quarterly upfront payment of RM3,000

Ladang YS’ s main challenge is that customer orders are received through WhatsApp or PO documents, manually interpreted and organized in Google Sheets, then processed into the required billing or order documents in SQL Accounting. The process is highly dependent on the owner’ s personal involvement.

3. Business Context

Ladang YS supplies coconut products to business customers, including F&B operators and selected hypermarkets.

Their operating model is relevant to MAIA because:

- Orders are received frequently through informal channels such as WhatsApp.
- Selected larger customers may send orders through B2B portals.
- Products are physical and stock-sensitive.
- Expiry visibility matters because the business handles coconut products.
- The client processes approximately 100 orders, PO, or invoices per week.
- The owner is closely involved in handling sales, order processing, admin work, and follow-up.

MAIA should be designed primarily around:

- Internal staff forwarding incoming orders into MAIA
- Customer and SKU identification
- Draft order or billing document preparation
- Stock and pricing reference support
- SQL Accounting-connected workflow
- Backend order visibility
- Inventory and expiring item visibility

Important for product team: Phase 1 is an internal operations workflow. It is not a customer-facing chatbot deployment.

4. Current As-Is Workflow

4.1 High-Level Current Flow

Step	Current Ladang YS Process
1	Customer sends an order through WhatsApp, or selected hypermart customer submits an order through its B2B portal
2	Ladang YS reviews the message or downloads the PO document from the portal
3	Order information is manually interpreted and keyed into Google Sheets
4	Orders are compiled in daily tables or tabs for internal tracking
5	Relevant customer, item, pricing, stock, or billing details are checked manually
6	PO, invoice, or agreed billing documents are generated through SQL Accounting
7	Fulfilment and delivery are handled based on the confirmed order and available stock
8	Follow-up and operational tracking continue across WhatsApp, Sheets, SQL Accounting, and internal coordination

4.2 Important Operating Detail

The current process begins with unstructured customer input. The client described WhatsApp orders as messy, which is why they rely on Google Sheets to consolidate daily orders before documents can be prepared.

This creates duplicated effort:

1. Read the customer request
2. Interpret the request
3. Key it into Google Sheets
4. Recheck the data
5. Prepare documents in SQL Accounting
6. Track what still needs action

Product team should understand that the immediate value of MAIA is not to replace SQL Accounting. It is to reduce the manual work that happens before and around SQL Accounting.

5. Main Pain Points

Pain Point	Current Situation	
Messy WhatsApp orders	Incoming order details need manual interpretation and compilation	Slower process, wrongly interpreted
Repeated manual key-in	Data moves from WhatsApp or PO documents into Google Sheets, then into SQL Accounting workflows	Wasted time
High owner dependency	The owner is heavily involved in sales and operational coordination	Difficult to scale
Limited single-view visibility	Order status is spread across WhatsApp, Google Sheets, SQL Accounting, and portal documents	Harder to know what is going on or requiring more data
SKU and item ambiguity risk	Coconut product descriptions may need confirmation against SKU references	Risk of wrong orders
Stock and expiry sensitivity	Coconut stock may require monitoring for expiry	Risk of waste
Manual follow-up burden	Outstanding actions may depend on the owner remembering or checking manually	Missed actions

6. Products and Item Understanding

Ladang YS sells coconut products and has SKU references for its products.

The product team should design Phase 1 around:

- Product/SKU identification from incoming messages or PO documents
- Confirmation when an order description could match more than one SKU
- Item and stock reference support
- Expiring item visibility where inventory data is available in the backend

6.1 Product Data Required

Data Required	Purpose
Item master list	Allow MAIA to reference available coconut products
SKU codes	Support accurate matching and document preparation
Product descriptions and common customer wording	Improve order interpretation
Unit of measure	Avoid quantity ambiguity
Customer-specific pricing, if applicable	Support correct pricing reference
Stock reference data	Support stock availability visibility

7. Customer Types and Buying Behaviour

Customer Type	Expected Order Source	Relevant Phase 1 Handling
F&B customers	Mainly WhatsApp	User forwards order into MAIA for extraction and draft preparation
Selected hypermarkets	B2B portal PO documents	User downloads PO and forwards document into MAIA
Repeat customers	WhatsApp or existing buying pattern	MAIA references customer and item data, subject to confirmation rules

7.1 Important Use Case: Ambiguous Product Order

A customer may send an order using an informal product name or a description that could relate to more than one SKU.

Expected MAIA behaviour:

1. Read the forwarded order.
2. Identify possible customer and item matches.
3. Ask the internal user to confirm the correct SKU where the item is unclear.
4. Proceed with draft preparation only after confirmation.

Do not allow the system to silently assume the correct SKU when there is ambiguity.

8. Order Intake Details

8.1 Order Formats

Based on the proposal, Phase 1 should support intake from:

Order Format	Phase 1 Handling
WhatsApp text order	Forward into MAIA for extraction and draft preparation
	Forward into MAIA for extraction and draft preparation

Downloaded PO document from B2B portal	
Voice, image, or document-based order	Included in the MAIA Phase 1 order assistant capability where workable under the agreed setup

8.2 Order Channel Boundary

For B2B portal orders, the included Phase 1 setup is:

- Ladang YS downloads the PO document from the portal.
- Ladang YS forwards the PO to MAIA.
- MAIA extracts information and prepares the relevant draft.

Not included in Phase 1:

- Automatic portal login
- Direct B2B portal order retrieval
- Automated portal monitoring

These should only be considered if separately scoped later.

9. Systems and Tools

System / Tool	Current or Proposed Role
WhatsApp	Main incoming order channel and internal MAIA interaction channel
Google Sheets	Current daily manual order compilation tool
SQL Accounting	Existing accounting and document reference system
B2B portals	Order source for selected hypermart customers
MAIA Backend Workspace	Proposed visibility layer for order status, tasks, inventory, and expiring items

Important: Use SQL Accounting only in all product planning and implementation documentation for this client.

10. Proposed MAIA Role for This Client

10.1 Phase 1 Positioning

MAIA should be treated as an **internal order-processing assistant and operational control layer**, not as a customer-facing chatbot.

The intended Phase 1 role is:

Help Ladang YS convert incoming WhatsApp and forwarded PO-based orders into structured, ready-to-confirm document workflows, with SQL Accounting references and clearer backend visibility.

10.2 What MAIA Should Do in Phase 1

Capability	Expected Phase 1 Behaviour
Order intake forwarding	Receive forwarded WhatsApp orders and PO documents
Customer identification	Reference the correct customer record where data is available
SKU identification	Extract ordered items and seek confirmation if ambiguous
Pricing reference support	Check customer-specific pricing based on available SQL Accounting
Stock reference support	Refer to stock information based on available and accessible data
Credit or overdue visibility	Check relevant information where data is available
Draft preparation	Prepare draft order or billing-related documents for user review
Confirmation before submission	Require user confirmation before final document generation
Backend workflow visibility	Show order status and pending tasks
Daily task visibility	Surface pending operational actions
Inventory visibility	Provide backend inventory viewing where data is available
Expiring item visibility	Allow users to view expiring items under Inventory > Expiring
Activity and document trail	Maintain basic tracking for agreed workflows
Training and go-live support	Support UAT, user onboarding, and rollout

11. Signed Scope and Commercial

11.1 Signed Commercial Arrangement Reflected in Uploaded Proposal

Item	Commercial Term
Package	MAIA Lite
Original Upfront Implementation Fee	RM20,000

Offered Upfront Implementation Fee	FOC under MAIA Lite offer
Monthly Subscription	RM1,000/month
Order Cap	Up to 600 successful orders/month
Minimum Commitment	3 months
Payment Cycle	Quarterly upfront
Initial Amount Payable	RM3,000
Renewal	RM3,000 per quarter if continuing after the first 3 months
Cancellation Notice	Ladang YS should inform Mindhive 1 month in advance

The proposal defines an order as counted only when the order is successfully created in the agreed system or workflow. It does not refer to every customer message, draft, discussion, or enquiry.

11.2 Third-Party Fees

The uploaded proposal states that the following fees are not included in the MAIA Lite subscription:

Excluded Fee	Responsibility
WhatsApp API charges	Client responsibility
Third-party system or vendor charges	Client responsibility
External hosting or platform fees, where applicable	Client responsibility
Accounting or billing system vendor charges	Client responsibility
Any paid third-party tools required by the client	Client responsibility

11.3 Commercial Clarification for Internal Team

The uploaded signed/merged proposal states:

- FOC implementation fee

- RM1,000/month
- Up to 600 successful orders/month
- Quarterly upfront payment of RM3,000

Product and implementation teams should follow the signed proposal unless management issues a documented commercial variation.

12. In-Scope Items

Area	Included Phase 1 Scope
Internal WhatsApp workflow	Internal-facing MAIA workflow for Ladang YS users
Order capture	Forwarded WhatsApp and supported message-based order intake
B2B portal PO handling	Process downloaded PO documents forwarded by Ladang YS
Customer and item reference	Customer and SKU identification support
Ambiguous SKU handling	User confirmation before proceeding when required
Pricing support	Customer-specific pricing reference support where data is available
Stock support	Stock availability reference support based on available and accessible data
Draft preparation	Prepare draft order or billing-related documents for review
Confirmation flow	User confirmation before final document generation
SQL Accounting setup	Agreed integration setup for the Phase 1 workflow
Backend visibility	Order status and pending task visibility
Inventory visibility	Backend inventory viewing where data is maintained
Expiring item visibility	Inventory > Expiring Item backend visibility
Activity/document trail	Basic visibility for agreed workflows
UAT and training	User acceptance testing, training, and go-live support

13. Out-of-Scope and Communicated Boundaries

The following items are not included in the signed Phase 1 scope unless separately approved:

Item	Boundary
Full ERP replacement	MAIA sits on top of SQL Accounting and does not replace it
Major SQL Accounting restructuring	Not included
Automatic B2B portal login and direct order retrieval	Not included, Phase 1 supports forwarded downloaded PO documents only
Customer-facing chatbot	Not included unless separately agreed
Advanced customer ordering pattern alerts	Optional Phase 2 setup
Custom dashboards or reports beyond agreed visibility	Not included
Additional setup items not listed in proposal	Not included
Third-party vendor implementation work	Not included
Bank transaction ingestion and automated payment matching	Not included in Phase 1
Automated official receipt batching after bank reconciliation	Not included in Phase 1

13.1 Internal Instruction for Product Team

Some items may become future opportunities, but product team must not treat them as committed Phase 1 delivery.

Correct handling:

- Deliver only the confirmed MAIA Lite scope.
- Confirm document and data availability during kickoff.
- Escalate any new workflow request for commercial and technical scoping.
- Avoid promising portal automation, payment reconciliation, or additional analytics without approval.

14. Important Workflow Clarifications

14.1 Sales Order, Invoice, PO, and DO

The proposal confirms that Ladang YS currently generates PO and invoices in SQL Accounting after compiling orders. The proposal also states that final document types and templates are subject to sample document review and technical feasibility.

The client later raised that **DO / Delivery Order** should be reflected in the operating process. Product team should confirm during kickoff:

--	--

Document	Clarification Needed
PO	Confirm when it is generated and for which order source
Sales Order	Confirm whether it is required as the internal order record
Invoice	Confirm timing, before or after delivery
Proforma Invoice	Confirm whether required in the actual Ladang YS flow
DO / Delivery Order	Confirm whether required for warehouse or delivery execution, and its template/source system
Official Receipt	Not part of Phase 1 automation unless separately scoped

14.2 Recommended Phase 1 Flow

Step	Recommended MAIA-Assisted Flow
1	Customer order is received through WhatsApp, or PO is downloaded from selected B2B portal
2	Ladang YS user forwards the order or PO document to MAIA
3	MAIA extracts customer, item, SKU, and quantity details
4	MAIA asks for user confirmation where information is unclear
5	MAIA references agreed customer, item, pricing, stock, and relevant status data
6	MAIA prepares the agreed draft document workflow
7	User reviews and confirms
8	Agreed document is generated or submitted through the SQL Accounting-connected workflow
9	If DO is confirmed as required, DO supports fulfilment and delivery execution
10	Order status is visible in the backend workspace
11	Inventory and expiring items can be viewed through the backend where data is available

15. Payment and Finance Flow

15.1 Current Phase 1 Position

The signed proposal includes credit limit or overdue payment checking where data is available. It does not include bank transaction matching, automated reconciliation, or automated official receipt handling.

Product team should not build automated payment reconciliation into Phase 1 unless separately approved.

15.2 Potential Phase 2 Custom Module Raised for Future Discussion

Ladang YS may later want a payment reconciliation and official receipt automation module.

Possible future workflow:

Step	Future Phase 2 Concept
1	Ingest bank account transactions
2	Match bank transactions against MAIA sales order listing
3	Auto-match transactions where transferer name and amount match, or where supporting payment slip is available
4	Highlight transactions where amount matches but payer does not match, using yellow status for finance action
5	Highlight fully unmatched transactions using red status for finance action
6	Finance team reviews and finalizes matching
7	Once finalized, MAIA automatically sends official receipts to salespeople in batches for sending to customers

15.3 Product Boundary

This future payment reconciliation module is:

- Not part of Phase 1
- Not included in the signed MAIA Lite scope
- A possible Phase 2 custom module/add-on
- Subject to separate workflow confirmation, technical feasibility, and commercial approval

16. Credit Control

Credit or overdue payment visibility is referenced within the Phase 1 proposal where data is available.

Product team should confirm:

Clarification Point	Reason
Whether credit limits are maintained in SQL Accounting	Needed before MAIA can reliably reference credit status
Whether overdue invoice status is available and accessible	Needed for warning visibility
Whether MAIA is expected only to display warnings or prevent processing	Important workflow rule
Which user can override a credit or overdue warning	Required for practical exception handling

Safe Phase 1 interpretation:

- MAIA may reference credit or overdue information where available.
- User confirmation remains required where action or override is needed.
- No automated finance reconciliation is included.

17. Stock, Inventory, and Expiring Items

17.1 What Is Included

Ladang YS deals with coconut products, which makes inventory and expiry visibility operationally relevant.

The proposal includes:

- Stock availability reference support based on available and accessible data
- Backend inventory visibility
- Expiring item visibility under **Inventory > Expiring Item**
- Stock and expiry reference support based on available inventory data in the system

17.2 Product Boundary

Inventory and expiry visibility depends on accurate data being available and maintained in the connected backend system.

Product team should confirm:

Data / Rule	Clarification Needed
SKU inventory records	Confirm item records and stock data structure
Expiry dates	Confirm where expiry data comes from
Batch or production date tracking	Confirm whether currently maintained
Freezer stock quantity	Confirm whether this is available in the backend inventory data
Stock availability logic	Confirm whether stock is reference-only or blocks order confirmation

Safe Phase 1 position:

Provide visibility and reference support based on available inventory data. Do not commit to new production, batch, freezer stock, or warehouse control workflows unless separately scoped.

18. Delivery and DO Arrangement

18.1 Current Understanding

Ladang YS supplies physical goods to customers. A DO / Delivery Order is expected to be relevant for fulfilment and delivery execution, although the precise DO workflow is not described in detail in the signed proposal.

18.2 What Product Team Should Confirm

Question	Purpose
Is DO generated for every delivery?	Determine standard document flow
Is DO generated in SQL Accounting?	Confirm integration/document source
Is delivery done internally or through third parties?	Determine operational handoff
Is signed DO or proof of delivery required?	Determine whether POD handling is needed

Does delivery affect invoicing timing?	Confirm document sequence
--	---------------------------

18.3 Safe Phase 1 Handling

If confirmed during kickoff, DO may be included in the agreed order and billing document flow, subject to:

- Sample document review
- SQL Accounting capability and access
- Technical feasibility
- Final agreed Phase 1 document list

Do not assume delivery route planning, driver tracking, or delivery optimization is included.

19. Order Source and Channel Situation

Ladang YS has at least two known order sources:

Channel	Handling in Phase 1
WhatsApp	User forwards customer order into MAIA
Selected hypermart B2B portals	User downloads PO document and forwards it into MAIA

Phase 1 should use the simplest controlled flow:

- Keep MAIA internal-facing.
- Require user review and confirmation.
- Use forwarded documents rather than automated external portal access.
- Avoid customer-facing or automated portal workflow commitments unless separately approved.

20. Customer-Facing vs Internal-Facing

MAIA is positioned as internal-facing for Ladang YS in Phase 1.

Item	Phase 1 Position
	Included

Internal user forwards customer orders to MAIA	
MAIA prepares drafts for internal confirmation	Included
Customer interacts directly with MAIA	Not included unless separately agreed
MAIA automatically commits orders without review	Not intended for ambiguous or exception cases

Reason:

The business needs greater control over customer, SKU, pricing, stock, and billing checks before documents are finalized. Internal confirmation reduces the risk of processing incorrect or unfulfillable orders.

21. Quotation and Document Flow

Quotation workflow is not clearly confirmed in the Ladang YS proposal.

Product team should not design Phase 1 around quotation unless it is confirmed during kickoff.

21.1 Document Review Required at Kickoff

Collect sample documents for:

- PO
- Invoice
- Sales Order, if used
- Proforma Invoice, if used
- DO / Delivery Order, if used
- Any billing document used in the actual SQL Accounting workflow

21.2 Product Handling Principle

Only configure documents that are confirmed as part of the Phase 1 order and billing workflow after sample document review and technical feasibility assessment.

22. Hosting, Integration, and Data Access

The proposal states that MAIA will sit on top of SQL Accounting and that the integration approach depends on data availability and accessibility.

22.1 Required Technical Clarifications

Product team must clarify during kickoff:

Item	Clarification Required
SQL Accounting access	What access can be provided and by whom
Vendor coordination	Whether SQL Accounting vendor involvement is required
Customer master data	Format and completeness
Item / SKU master data	Format and completeness
Pricing data	Whether customer-specific prices are accessible
Stock data	Whether stock visibility data is accessible
Expiry data	Whether expiry records are available and maintained
Document templates	Which documents need to be configured
WhatsApp/API fees	Confirm client responsibility under signed proposal

23. Data Required Before Build

Data Required	Why Needed
Customer master list	Customer identification and order reference
Item/SKU list	Item extraction and SKU confirmation
Customer-specific pricing, if applicable	Correct price referencing
Stock availability data, if applicable	Stock visibility and order checking
Expiry/inventory data, if applicable	Expiring item visibility
Sample WhatsApp orders	Test actual order wording and extraction
Sample B2B portal PO documents	Test document extraction workflow
Sample PO and invoice templates	Confirm actual document handling
Sample DO, if used	Confirm delivery document flow

User list and roles	Define access and UAT users
Confirmed exception rules	Handle ambiguous items, pricing issues, or insufficient data

24. Suggested UAT Scenarios

Scenario	Expected Result
Clear WhatsApp order with valid customer and SKU	MAIA prepares correct draft for user confirmation
WhatsApp order with unclear item description	MAIA asks user to confirm the correct SKU
Forwarded hypermart PO document	MAIA extracts relevant order data and prepares draft
Customer-specific pricing available	MAIA references agreed customer pricing information
Stock reference data available	MAIA surfaces relevant stock status
Credit or overdue information available	MAIA surfaces relevant visibility or warning
User reviews and confirms a draft	Agreed document workflow proceeds
Backend order visibility	User can see workflow status and pending tasks
Inventory data includes expiring items	User can view relevant information under Inventory > Expiring Item
Missing or inaccurate inventory data	MAIA does not imply reliable expiry visibility without valid data
Unconfirmed document type such as DO	Workflow is held for configuration confirmation, not assumed
Automatic portal retrieval request	Treated as out of Phase 1 scope and escalated for separate scoping
Bank reconciliation request	Treated as Phase 2 custom module opportunity, not Phase 1 delivery

25. Key Risks for Product Team

Risk	Mitigation
Product team assumes all documents are included	Confirm document list and sample templates at kickoff
B2B portal handling is mistaken for full portal automation	Maintain forwarding-based PO workflow only in Phase 1
Expiry visibility is promised without complete inventory data	Validate data availability before confirming output quality
DO is assumed without confirming the actual flow	Collect sample DO and agree workflow before build
Client expects automated bank reconciliation	Communicate that it is Phase 2 custom module scope only
Client expects customer-facing chatbot	Keep Phase 1 internal-facing unless separately approved
SQL Accounting data access is limited	Confirm technical access early and adjust setup if needed
Commercial arrangement is misunderstood	Follow the signed proposal terms unless revised formally

26. Product Team Recommendation

Implement Phase 1 as an internal message-to-order and document-preparation workflow connected to SQL Accounting, with backend operational and expiring item visibility.

26.1 Recommended Phase 1 Build Focus

Priority	Build Focus
1	Internal WhatsApp order forwarding workflow
2	Forwarded B2B portal PO document processing
3	Customer, item, and SKU identification
4	Ambiguous SKU confirmation
5	Pricing and stock reference support where available
6	Draft order or billing document preparation

7	User confirmation before final submission
8	SQL Accounting-connected workflow
9	Backend order status and pending task visibility
10	Inventory and expiring item visibility where data is available
11	UAT, training, and go-live support

26.2 Do Not Build Under Phase 1 Without Separate Approval

- Automatic B2B portal login or direct retrieval
- Customer-facing chatbot
- Advanced customer ordering pattern alerts
- Automated bank transaction matching
- Automated finance reconciliation
- Automated OR batching and sending
- Full inventory restructuring
- New batch or production tracking workflow
- Delivery route planning or optimization
- Custom dashboards beyond agreed visibility

27. One-Line Product Summary

Ladang YS is a coconut products supplier serving F&B businesses and selected hypermarkets, currently processing approximately 100 orders, PO, or invoices per week through a manual WhatsApp and B2B portal PO to Google Sheets to SQL Accounting workflow. Phase 1 should position MAIA as an internal order-processing and operational control layer that helps staff forward incoming orders, identify customers and SKUs, reference available pricing and stock information, prepare agreed document drafts for confirmation, provide backend order visibility, and show expiring item information where backend inventory data is available. MAIA should sit on top of SQL Accounting, while automatic portal retrieval, customer-facing workflows, advanced customer pattern alerts, bank reconciliation, automated OR handling, and any unconfirmed DO or delivery enhancement remain outside Phase 1 unless separately approved.

Note for internal alignment: The source proposal already appears signed on the acceptance page and reflects the MAIA Lite commercial terms stated in Section 11 above. Any alternative pricing arrangement should be documented as a revised agreement before product or implementation teams rely on it. file
