

Tech War Room → 74 open items · 5 accounts · one day

Tuesday 4 Aug 2026, 10:00 · DIY Ventures · Ladang · Dalson · Holsten · Lean Giap

Sources: 3 PM briefing transcripts (3 Aug) + 6 gap documents + 22 screenshots · tick items as they close

Read this before the room fills. The mandate as stated is not achievable, and pretending otherwise costs you the week.

74 open items. 27 of them block a UAT. 14 are P0. "All sorted by today" across five accounts, with Amirul out and Jermaine remote, is not a plan — it is the shape of a day where every lane gets 60% done and nothing ships. Yesterday's 48 became today's 74 because three more documents landed, not because the team went backwards.

What today can actually deliver: the 14 P0s closed, every one of the 27 blockers owned with an hour-level ETA, and three go/no-go calls made and communicated. That is a genuinely good day. Chasing all 74 gets you none of it.

And one thing that did not get decided last night: DIY Ventures' UAT was scheduled for today. If that call is still open at 10:00, it is the first item — not the fifth.

Evidence gap: 22 attachments and 3 feedback sheets could not be retrieved

Every screenshot in the three new documents arrived as [This type of content is unavailable for download at the moment.], and Lean Giap's **Order Intake, AR and AP feedback sheets** came through as unlinked images. No URLs were present in the delivered files, so there was nothing to fetch — I checked the raw documents, not just the rendered text.

Every Lark and Jam link that survived is preserved as a clickable reference on its card — currently only Ladang's Jam capture on EXT-2. Cards whose evidence is missing carry an empty reference slot; drop recovered Lark docs and Jam captures straight in there so the evidence trail stays attached to the finding instead of scattered across chat threads.

The Lean Giap gap is the serious one. Three sheets of client UAT feedback on the account that did *not* sign off are currently unread by anyone preparing this room. Whoever holds Lean Giap needs to paste that content in before 10:00, or the account goes into the war room represented by four bullet points. Items carried over from 3 Aug retain their screenshots below.

CONTENTS

- | | |
|---|--|
| → 1 · Today's clock — what is genuinely due | → 4 · Room agenda — 10:00 to 10:45 |
| → 2 · Squad board — 10 parallel lanes | → 5 · Conflicts & decisions needed today |
| → 3 · Triage matrix | → 6 · All 74 items, by squad |
| → 7 · Six root causes | |
| → 8 · Not-tech blockers | |
| → 9 · Sources & confidence | |

"Everything by today" is the instruction. This is what **actually** has a today-shaped deadline versus what is being pulled forward by anxiety. Work the left column first.

■ HARD — TODAY

Due 4 Aug or it breaks

- > **DIY Ventures UAT** — scheduled today. Go/no-go unresolved
- > **Lean Giap Epicor sync** — Eric, end of day, or Finance cannot test this week
- > **ARAP-before-order decision** — Finance is waiting on an answer to start
- > **Lean Giap AR/AP/Order sheets** — unread, needed before triage means anything
- > **14 POs** — the only fix list that must fully close

▲ WED 5 AUG — CHECKPOINT

Decide, don't fix

- > **Ladang** go/no-go — integration + duplicate pricing must be in by 12:00
- > **Dalson** go/no-go — plus the questionnaire session, still unbooked
- > Dalson cash-sales session, if the standup date is the correct one

◆ THU 6 AUG

The two UATs

- > **Ladang UAT** — 8 blockers open
- > **Dalson UAT** — 11 blockers open
- > Dalson wholesale training, same week

○ THIS WEEK / NEXT

Real, but not today

- > **Holsen** — training gaps; fulfilment chain is broken end to end, no date attached
- > **Lean Giap Finance** — tests this week
- > **Lean Giap Ops** — tests Mon/Tue next week, peak season now

2 · SQUAD BOARD — 10 PARALLEL LANES

Lanes are cut so they can run **simultaneously without colliding**. Owners are proposed — confirm each in the first five minutes and write the name on the board. A lane with no name on it does not get worked today.

INT **Integration** Wei Yon + integrations

Single highest-value lane. Two accounts cannot demo anything without connector activation. Distinct from the non-prod write cap, which is a known and accepted limitation carrying no work.

5/5

CALC **Line-item core** backend + frontend

Precision, recompute, UOM, validation. **Do not assign these individually** — get the line-item contract from Jermaine first (cause 02).

3/4

FUL **Stock, batch & fulfilment**

backend — NEW LANE

Entirely new from Holsen. **Picklist and DN submission are both broken**, so Holsen cannot complete a single delivery today. Highest severity of any new block.

3/8

SRCH **Matching & search**

Afiq · RAG with Ivan

Now 12 items across four accounts. The RAG dependency is unchanged and still sits with you personally.

9/12

EXT **Extraction** chatbot / Afiq

Line-level data — dates, remarks, buyer SKU, quotation refs. Some needs schema before extraction has anywhere to write.

6/7

CHT **Chatbot** Afiq

Latency plus a new class: **the chatbot acts and the front end doesn't know** (cause 06). Afiq now owns three lanes — that is a bottleneck, name it.

7/8

D0C

Documents & PDF

backend — templates

Nine items. **Discount rule now decided: default show.** Holsen's two PDF items drop out of this week's scope — they move to SQL later and reuse the SQL generators.

6/9

CFG

Config & instance hygiene

product — minutes each

Near-zero engineering cost, and one item takes down a live sync. **Clear the whole lane in the room**, don't ticket it.

1/5

L6

Lean Giap AR/AP

Jermaine + Eric — NEW LANE

Separate track, separate clock. Mostly decisions and data, not code — **keep it out of the main fix queue** or it will absorb attention it doesn't need.

4/5

STK

Stock movement view + UI

Amirul — OUT, reassign

All P2/P3, all deferrable. **Explicitly park this lane today** so nobody spends an afternoon on a frozen table column.

0/10

3 · TRIAGE MATRIX — SEVERITY × UAT GATE

Two axes deliberately. **P-level is how badly it hurts in production; gate is whether it stops this week's session.** Work the *Blocks* column today and the P column on Friday. Yesterday's figures in brackets. **Accepted** is a known limitation we have decided to live with — it stays visible so nobody re-raises it as a defect, but it carries no engineering work.

SEVERITY	BLOCKS UAT	DEGRADES UAT	AFTER UAT	ACCEPTED	TOTAL
P0 Critical failure	14 (7)	0	0	0	14
P1 Trust-eroding	13 (9)	17	0	0	30
P2 Annoying, survivable	0	15	5	1	21
P3 Minor usability	0	0	9	0	9
Total	27 (16)	32	14	1	74

Blockers went from 16 to 27 overnight, and the intake isn't finished — Lean Giap's three feedback sheets are still unread and Holsen's list came from a training session, not a UAT. Assume the true number is higher than 27, and plan on the assumption that tomorrow adds more rather than that today clears the deck.

4 · ROOM AGENDA — 10:00 TO 10:45

Forty-five minutes, then people go and work. **A war room that runs two hours has become a status meeting.** Everyone reads this document before 10:00; nothing below is a walkthrough of findings.

TIME	ITEM	OUTCOME BEFORE MOVING ON
10:00	DIY go / no-go — first, not last	It was scheduled for today and the call was left open overnight. Decide in three minutes. If AutoCount isn't live, it isn't an integration UAT — either move it or reframe it as a scoped walkthrough, and the client hears it from us this morning

TIME	ITEM	OUTCOME BEFORE MOVING ON
10:03	Name every lane	Ten lanes, ten names on the board. Amirul is out; Afiq currently owns three. Fix the Afiq bottleneck here or three lanes move at one lane's speed
10:10	The 14 POs	Owner + hour-level ETA each. Integration ×2, line-item core ×3, fulfilment ×3, chatbot state ×1, config ×1, Lean Giap ×3, PDF ×1. This is the only list that must fully close today
10:22	Two product decisions left	The discount rule is settled and the ARAP collision was a false alarm. Still open and still sitting on engineers' desks : quotation status lifecycle (DATA-1) and the MAIA-vs-AutoCount template setting (DOC-3). Decide both, don't defer
10:32	Wednesday checkpoints	Ladang and Dalsen each get a named time and a named condition. "We'll see how it goes" is not a checkpoint
10:38	Lean Giap + Holsen intake	Three unread feedback sheets and a training-gap list with no date. Owners for both, today — these are the accounts nobody in the room is currently thinking about
10:42	Close	Tick items here as they land. Next sync 16:30 — closed items only, no discussion of anything still open

5 · CONFLICTS & DECISIONS NEEDED TODAY

These are not bugs. They are **product decisions currently blocking engineers**, and two of them are cases where doing what each client asked would produce contradictory code in the same template.

DECISION 01 · SETTLED — DOC lane unblocked

Discount column defaults to shown; Holsen waits for SQL

Ruling: default show. DOC-5 (Dalsen quotation PDF) builds to that default and needs no further product input.

Holsen's two PDF items come out of this week's scope. They move to SQL later and will reuse the SQL PDF generators, so custom template work on their current setup would be thrown away. DOC-8 and DOC-9 are reclassified to *after* and ride the SQL migration.

Worth banking the rule and not just the answer: **an account with a known platform migration ahead of it should not receive template-layer custom work in the interim.** That generalises past Holsen, and it is the kind of call that saves a week somewhere else next month. Someone should own writing it into the delivery playbook — otherwise it gets re-litigated per account.

DECISION 02 · blocking Lean Giap

Can AR/AP go live before order intake?

Lean Giap's Finance team want to start on MAIA immediately. Operations can only test next Monday or Tuesday because this is their peak week. Finance is asking to decouple.

Correction to yesterday's read: Lean Giap's AR and Macro Frozen's AR are separate builds. There is no delivery collision and Macro's 15–21 Aug date is unaffected whichever way this goes. That removes the main structural argument against letting Finance start early.

What still needs answering before saying yes: **what AR reconciles against while order intake isn't live**, and whether a partial go-live sets a servicing precedent across the portfolio. Both are answerable this morning, and with the collision gone the decision is now mostly upside.

DECISION 03 · blocking DOC + DATA lanes

Quotation status lifecycle — what does "expired" mean once documents exist downstream?

Dalson found a quotation marked **expired** that has both an invoice and a delivery note created from it. Either the expiry job ignores downstream documents, or the status model has no "ordered" state to move into. Product needs to define the lifecycle before engineering picks one — this is a state-machine decision, not a bug fix.

DECISION 04 · carried from yesterday, still open

MAIA native template vs AutoCount PDF — make it a setting, not a per-client hack

Dalson are integrated to AutoCount but prefer MAIA's own templates. Unchanged since yesterday and still unresolved. Same shape as decision 01: **generalise it once** rather than hardcoding a preference that will recur on every integrated account.

6 · ALL 74 ITEMS, BY SQUAD

Tick as they close — the bars at the top and on each lane update live. Items marked **NEW** arrived with today's three documents. Screenshots exist only for items carried from 3 Aug; click to enlarge.

INT Integration & sync Wei Yon + integrations

5/5

Still the highest-value lane in the building — two accounts cannot demonstrate anything end-to-end until connector activation lands. **Note the distinction:** INT-1 and INT-2 are per-client activation failures and are real work. INT-4 is the non-production write cap — a platform limitation, accepted, and not a defect to chase.

INT-1 P0 BLOCKS **DIY**

AutoCount connector never activated for DIY Ventures

The connector is bound to **FixGuru's database only**. On DIY's instance nothing is connected — no PDF pull, no two-way sync, no end-to-end demo. Everything downstream is gated on this, including today's session.

OWNER Integrations / Wei Yon TYPE Activation, not build DUE Before any DIY session

Source: DIY briefing 05:23–05:38, 40:00–40:32

INT-2 P0 BLOCKS **Ladang**

AutoCount not activated for Ladang; external PDF generator not working

Same activation gap, plus the third-party PDF generator does not regenerate documents. PDF pull had not been tested at all at time of briefing. Two-way sync also outstanding.

OWNER Integrations / Wei Yon CHECKPOINT Wed 12:00

Source: Ladang briefing 18:54–19:15, 32:38–32:53

INT-3

P1

DEGRADES

Ladang

261 documents not synced — needs a written reconciliation statement

Sync ran to **24 July**, carrying ~26k documents. 261 excluded: cancelled documents, unreconcilable payment receipts, debit notes. The two systems will not tie out and the client will notice. This is a disclosure to write and send *before* the session, not explain after.

OWNER Jun Yan · data from integrations DELIVERABLE Sync statement to client

Source: Ladang briefing 19:17–20:01

INT-4

P2

ACCEPTED

DIY

✓ CONFIRMED

AutoCount non-production instance: 500-record write limit — accepted limitation

The AutoCount non-production instance carries a **500-record write limit**. MAIA can create documents but cannot write them back, so the return leg of two-way sync cannot be exercised in non-prod.

Accepted, not a defect. It is a constraint of the environment rather than the product and it does not exist on production. No engineering work attaches to it, and it should not be re-raised as a bug when the next tester hits it.

The one thing still owed is **the sentence that gets said in the session**: write-back is out of scope for this UAT because we are on a non-production instance. Stated up front it is a footnote; discovered live it looks like a failure.

OWNER Product — one line in the UAT script ENGINEERING None

Source: DIY gap doc · confirmed by Ivan, 4 Aug

INT-5

P2

AFTER

Dalson

Dalson integrated against a demo tower sitting inside production — confirm intended

Stated as "integrated to their demo tower in their production". If that is a demo dataset inside the production environment it changes what a UAT sign-off actually certifies. One sentence of confirmation from Gareth.

OWNER Gareth → Jermaine

Source: DIY briefing 11:31–16:02

CALC-3

P0

BLOCKS

Dalson

~~Deleting a line item corrupts all field validation — no recompute on add/remove~~

Delete one line from a CPO and **every remaining field's validation state goes wrong**. No recompute on line add or remove, and the front end lets invalid state through. Exactly what a client does within ten minutes of being handed the keyboard.

OWNER Frontend REPRO Dalson CPO, delete any line

Source: Dalson briefing 1:06:16–1:07:31

CALC-4 P0 BLOCKS DIY Dalson

Cash sales invoice support — ETA of 12:00 yesterday has lapsed

Open functional gap tracked as "cash sales invoice update from Azib by 12pm" **on 3 Aug**. Yesterday's standup separately had Azib coordinating with Jermaine on Dalson cash sales ahead of a Wednesday session. Two accounts, one unfinished feature, sources disagreeing on which UAT it lands in front of, and the deadline is now a day old. **Confirm status first, then re-ETA.**

OWNER Azib + Jermaine STATUS ETA lapsed 24h

Source: DIY briefing 40:36–40:42 · daily standup 3 Aug

CALC-2 P1 BLOCKS DIY

Cannot set a line total and back-solve the unit price

Only unit price is editable. When a PO states a line total that doesn't reconcile to $\text{unit} \times \text{qty}$, there is no way to pin the total and recompute the unit price. Affects **CPO, SO and SI**. Normal practice, not an edge case — and with CALC-1 unfixed it is the only manual escape hatch users have.

OWNER Frontend + backend SCOPE CPO / SO / SI

Source: DIY briefing 12:02–13:36

FUL **Stock, batch & fulfilment** backend — new lane

3/8

Entirely new, entirely from Holsen, and the most severe cluster to arrive today. Picklist submission and delivery note submission are both broken — which means Holsen cannot complete a single delivery end to end right now. This surfaced in a *training* session, so the client has already seen it fail. Proof-of-delivery items sit in this lane too.

FUL-1 P0 BLOCKS Holsen NEW #389

DN submission blocked by false negative-stock error after stock/batch qty update

Quantity is added at stock entry and batch level, but submitting the DN against that batch throws **negative stock quantity of -2.0**. The stock is there; the submission check isn't reading the updated batch qty.

This stops delivery entirely. Combined with FUL-4 and FUL-5, Holsen currently has no working path from sales order to delivered goods.

OWNER Backend — stock ledger SEVERITY Blocks all fulfilment

△ Screenshots referenced but not retrievable — request the two attachments from Holsen doc #389

FUL-4 P0 BLOCKS **Holsen** NEW #385**Picklist submission fails when picked qty differs from SO qty**

The picklist rejects submission if picked quantity is higher or lower than the ordered quantity. **Short-picking is normal warehouse behaviour**, not an error state — the whole point of a picklist is to record what was actually picked.

Reuse opportunity: this is the same problem as Macro Frozen's picked-quantity breakdown, already scoped as tuple columns on Pick List Item and Delivery Note Item. Check with Amirul's work before rebuilding it — one fix, two accounts.

OWNER Backend REUSE Macro Frozen picked-qty build

△ Screenshot referenced but not retrievable — request from Holsen doc #385

FUL-5 P0 BLOCKS **Holsen** NEW #384**Picklist submission returns "already submitted" but stays in draft after refresh**

Submitting returns an error claiming the picklist is already submitted, yet after refresh it is still draft. **The write is failing and the error message is lying about why** — which is worse than a clean failure, because the user has no idea whether to retry. Likely a duplicate-submission guard firing before the state transition commits.

OWNER Backend — state transition

△ Two screenshots referenced but not retrievable — request from Holsen doc #384

FUL-3 P1 **DEGRADES** **Holsen** NEW #387**Batch total qty not shown when selecting a batch in SO or picklist**

Selecting a batch number gives no indication of how much is in it, so the user picks blind and only discovers the shortfall at submission — which is where FUL-1 then fires. **Fixing this reduces how often FUL-1 gets hit**, independent of the ledger fix.

OWNER Frontend INTERACTION Mitigates FUL-1

△ Screenshot referenced but not retrievable — request from Holsen doc #387

FUL-2 P1 **DEGRADES** **Holsen** NEW #388**Stock entry does not display UOM alongside item quantity**

A quantity without its unit is not a quantity. **Third separate place where UOM goes missing** — see also SRCH-8 (no UOM at CPO after mapping) and Ladang's unit-notation match failures. Part of cause 02, not an isolated display bug.

OWNER Frontend PATTERN UOM dropped in 3 places

△ Screenshot referenced but not retrievable — request from Holsen doc #388

POD-1 P1 BLOCKS **Dalson****Proof-of-delivery attachment by external ID fails — DN not searchable by external ID**

Attaching proof against `DO-001861` fails because the delivery note cannot be found by **external ID**, though the DN is visible in the listing carrying that ID. Dalson's staff work in SQL-side external IDs. Proof of delivery is central to their signed narrative — this failing live is bad on the one workflow they bought.

OWNER Backend — search by external ID REPR0 DO-001861

Source: Dalson briefing 18:20–22:22

☐ POD-2 P1 BLOCKS Dalson

Marking a delivery note delivered takes two steps — must be one

Today: attach proof, then separately mark delivered. Should be a **single API call doing both** — attaching full proof of delivery *is* the confirmation. Two steps means staff reliably do one and not the other, and the data drifts.

OWNER Backend
Source: Dalson briefing 23:13–23:38

☐ POD-3 P1 DEGRADES DIY

Delivery note must show weight and volume — volume is the operative metric

DIY load lorries the way FixGuru do. Because they sell packaging material, **volume matters more than weight** — low-density goods fill a truck long before they load it out. Without volume the DN doesn't support the decision it exists to support.

OWNER Backend + frontend PRECEDENT FixGuru implementation
Source: DIY briefing 45:09–46:16

SRCH Matching & search Afiq · RAG with Ivan

9/12

Grown from 8 to 12 items across four accounts. Today's Dalson document adds four *customer*-matching failures to what was previously mostly an item-matching problem — **the same weakness now shows on both sides of the record**.

☐ SRCH-10 P1 BLOCKS Dalson NEW

Quotation-originated customers not in the database are silently treated as cash sales

A customer that exists on the quotation but not in the customer table gets **classified as a cash-sales customer** rather than flagged for creation. Silent misclassification is worse than a visible failure — the order

goes through, the record is wrong, and nobody finds out until reconciliation. Should surface as "customer not found, create?" not resolve to a default.

OWNER Backend — matching fallback RISK Silent, not visible

⚠ No screenshot delivered — request from Dalson doc item 3

SRCH-11 P1 BLOCKS Dalson NEW

CPO item matching searches the item name, but the PO text matches the item description

The exact item string on Dalson's CPO corresponds to the **description** field of the item record, not its name — so matching against name alone fails on documents that would otherwise be exact hits. Extending the match to include description is a far cheaper win than any search-algorithm change.

The gap doc asks whether the client should rename items for consistency. **Push back on that.** Asking a client to restructure their catalogue to suit our matching is the exact failure mode the product exists to remove — and it does not scale to account 18.

OWNER Backend — match on description EFFORT Low, high yield

⚠ No screenshot delivered — request from Dalson doc item 4

SRCH-6 P1 BLOCKS DIY

Customer search by phone number — unverified, and their entire flow depends on it

DIY's orders arrive over WhatsApp; staff identify customers by number, not name. If phone search doesn't work, the primary lookup path is broken. Flagged as must-verify and **still not tested**.

OWNER Product to verify → backend EFFORT Test first, may be nothing

Source: DIY briefing 31:14–31:28

SRCH-7 P1 BLOCKS Ladang

Customer × item price returns duplicate rows — Ladang instance only

The pricing endpoint returns **three identical rows** for the same item on Ladang; Macro behaves normally. Instance-specific, so likely data or config rather than code. **Open since Friday 31 July** and assigned to Amirul, who is out — this needs a cover name before the room starts, not during it.

OWNER Amirul — OUT. Reassign AGE 4 days open

Source: Ladang briefing 21:58–23:31

Same item returned three times

SRCH-8 P1 BLOCKS Dalson

No UOM selectable at CPO after item mapping, despite UOM configured on the item

Item syncs from Dalson with UOM set (pieces), but after mapping the CPO offers **no unit of measure to select**. Without UOM the line can't be validated or priced correctly — upstream of half the matching complaints rather than beside them. See also FUL-2.

OWNER Backend — mapping layer

Source: Dalson briefing 57:47–59:14

SRCH-2 P1 DEGRADES All accounts

Item matching is heuristic-only — no unit normalisation, no semantic fallback

Every account produces the same shape of failure:

- **Unit notation** — PO says 0.5m, catalogue holds 50cm
- **Semantic drift** — Ladang's Nangka PKT returns Kedondong
- **Spec vs quantity** — Velcro 10mm x 1m against a 25m item; client compensates by ordering 24
- **Vendor prefixes** — Stanley 10-143-S vs 10-143-S
- **DIY unmatched:** Bubble double H40", Stretch film clear w500mm x 1.7kg x 200g

Named fix is RAG / vector search. Unbuilt, and owned by Ivan personally — see cause 03. SRCH-11 and EXT-4 are the cheap partial mitigations that don't depend on it.

OWNER Ivan (RAG) · Afiq (heuristics) **SHORT TERM** Client SKU clarification list

Source: DIY briefing 21:05–24:43 · Ladang gap doc · Dalson briefing 55:52–57:39

SRCH-9 P1 DEGRADES Dalson NEW

Correct customer ranked below others — inconsistent between POs

On one PO the correct customer is not the top candidate even though every customer is returned; on another PO the same customer ranks first. **Inconsistent ranking is harder to trust than consistent failure** — users stop believing the top candidate at all, which removes the value of ranking. Needs the scoring function inspected, not just the result set.

OWNER Backend — ranking

▲ No screenshot delivered — request from Dalson doc item 2

SRCH-3 P1 DEGRADES Dalson

Original top candidates lost after CPO-mapping

The candidate list from before mapping isn't preserved, so a user who spots a bad auto-match can't fall back to the ranked alternatives — they restart the search. Small change, large effect on how recoverable a bad match feels. **Pairs directly with SRCH-9:** if ranking is unreliable, keeping the alternatives visible matters more.

OWNER Frontend + mapping

Source: Dalson briefing 53:40–54:58

SRCH-1 P1 DEGRADES DIY

Customer search fails on punctuation

YANG INDUSTRIAL SDN. BHD. doesn't match YANG INDUSTRIAL SDN BHD. Normalise punctuation and whitespace on both sides before comparison. Cheap, and it removes an embarrassing class of live failure — Malaysian entity suffixes are written inconsistently on essentially every document.

OWNER Backend — normalisation EFFORT Low
Source: DIY briefing 16:11–16:37

SRCH-12 P2 DEGRADES Dalson NEW

Cannot search a customer by secondary contact when the primary contact is empty

Search only looks at the primary contact field — phone and email both. If the primary is blank, a customer with a perfectly good secondary contact is unfindable. Search across all contact rows, not just the flagged primary.

OWNER Backend — search scope
△ No screenshot delivered — request from Dalson doc item 5

SRCH-4 P2 DEGRADES DIY

Item listing shows the internal ID even when an external ID exists

Search results display MAIA's internal item code rather than the client's external ID, so users can't recognise

SRCH-5 P3 AFTER DIY

~~Empty search state needs an advanced search modal and a create item CTA~~

When nothing is found the user hits a dead end. Open an advanced item-search modal, and offer "create new item" inline. Feature request, not a defect.

OWNER Product → design

Source: DIY gap doc

EXT **Document extraction** chatbot / Afiq

6/7

All line-level. **Separate schema work from extraction work before ticketing** — some of this has nowhere to write to yet.

EXT-6 P1 BLOCKS Dalson UPGRADED

CPO does not extract the quotation number or link back to the quotation

Escalated from "degrades" to "blocks" by today's document, which specifies the exact mechanism.

Dalson's sequence: quotation issued to customer → customer sends a PO carrying the quotation reference → Dalson attaches the quotation to the CPO. *Most* of their customers' POs carry a QTN number.

Required: **extract the QTN number from the PO and auto-link the CPO to the created quotation**. Today that link is manual and lossy. Related case: a PO containing more items than the quotation it references — the link must tolerate partial overlap rather than assume a clean match.

Note the knock-on: SRCH-10's cash-sales misclassification happens *because* the customer is being resolved from the quotation. Fixing the link properly reduces that failure too.

OWNER Extraction + backend UNBLOCKS SRCH-10

Source: Dalson briefing 33:42–33:59, 39:46–40:00 · Dalson gap doc 4 Aug item 3

EXT-1 P1 BLOCKS Ladang

~~Line-item delivery dates: only one date extracted where each line carries its own~~

Ladang's test case `PO-CC26-038` is one CPO, three lines, same SKU, **three different delivery dates**.

Extraction takes a single date. The schema supports item-level dates; extraction isn't using it. Their named use case, and Ivan confirmed the pattern exists on other accounts too.

OWNER Extraction REPR0 PO-CC26-038.pdf

Source: Ladang briefing 05:11–09:43

EXT-2 P1 BLOCKS Ladang

Front end renders the same delivery date across three lines — chatbot and PDF are correct

On `SO-2026-00016` the chatbot and PDF show three distinct dates; **the front end shows one date on all three lines** and omits it entirely from the multi-line description. A rendering bug, and the more dangerous kind — the data is right underneath and nobody notices until the client reads the screen. Same family as CHT-8 (cause 06).

REFS [▶ Jam capture — SO-2026-00016](#)

OWNER Frontend REPRO SO-2026-00016 + Jam
Source: *Ladang briefing 38:41-40:05*

EXT-3 P1 DEGRADES Dalson

Item-level remarks and notes are not extracted

Dalson's POs carry notes against individual lines — specs, handling instructions — and none comes through. The model also has **no note field at line-item level** to receive it, so this is a schema change plus an extraction change, not a prompt tweak. Their documents run to seven pages precisely because of this detail.

OWNER Backend (schema) + extraction REPRO PO-CP1134267_v1_20260714.pdf
Source: *Dalson briefing 45:40-46:26, 50:23-50:35*

Source PO carries line notes

Extracted data — remarks absent

EXT-4 P1 DEGRADES Dalson

Buyer-SKU not extracted, though it is printed on the document

The customer SKU field comes through empty even where the PO clearly prints one. That field is the **highest-confidence matching signal available** — extracting it resolves a meaningful share of SRCH-2 without touching the search algorithm. Cheapest available lever on match quality, and it does not depend on RAG.

OWNER Extraction LEVERAGE Feeds SRCH-2 directly
Source: *Dalson briefing 52:29-53:06*

EXT-5 P2 DEGRADES Ladang

CPO item name should show the full description, as the SO does

The CPO shows a truncated name while the SO shows the description. With three lines of the same SKU differing only by delivery date, the CPO view gives the user nothing to tell them apart. **Same underlying field mismatch as SRCH-11** — worth fixing together.

OWNER Frontend PAIRS WITH SRCH-11
Source: *Ladang gap doc*

EXT-7 P3 AFTER Dalson

"Special instruction" field — nobody in the room could say what it is for

Appears on the CPO with no defined purpose. Either it has a use nobody documented, or it is surfacing to clients without meaning. Define it or hide it before Thursday — an unexplained field invites the question you can't answer.

CHT Chatbot Afiq

7/8

Doubled from 4 to 8. The new Dalson items introduce a genuinely new failure class: **the chatbot acts on the data and the front end doesn't know** (cause 06), plus three separate defects in one feature — historical pricing URL handling.

CHT-8 P0 BLOCKS Dalson NEW #378

Chatbot converts CPO to SO, but the front end still shows a CPO

The chatbot creates a draft SO from a CPO. **The front end does not reflect the conversion.** Two surfaces now disagree about what state a live document is in — a user looking at the screen will convert it again, or treat it as unprocessed.

This is P0 not because of the visual, but because **duplicate document creation follows directly from it**, and duplicates in an order pipeline are expensive to unwind. Same root as EXT-2.

OWNER Backend + frontend — state sync RISK Duplicate SO creation
Screenshot referenced but not retrievable — request from Dalson doc #378

CHT-1 P1 BLOCKS All accounts

Response latency of 30 seconds to 1 minute

Observed on Ladang, but the chatbot is shared — assume every session. **A minute of silence in a live UAT reads as broken** regardless of the eventual answer, and it compounds in an online format where the whole room watches the same spinner. The gap doc asks whether OpenAI is slow; **measure before concluding** — split the time between model call, tool/DB call and our own processing.

OWNER Afiq — instrument first INTERIM Set expectation in-session
Source: Ladang gap doc

CHT-2

P1

DEGRADES

Ladang

Multi-line item handling in chat — unverified

Flagged, not tested end to end. Ladang's customers send free-text WhatsApp orders with several items in one message — their primary input path, not an edge case.

OWNER Product to test → Afiq

Source: Ladang gap doc

CHT-5

P2

DEGRADES

Dalson

NEW #382

Historical pricing URL type is inconsistent — standalone UI vs draft SO details page

The chatbot returns different URL types depending on context, apparently at random. Defined expectation: **lookup only → standalone historical-pricing page** (whose final step leads to create order/QTN/invoice); **draft SO/QTN/invoice already exists and the user wants to update price → the doctype details page**. The rule is clear; the implementation isn't branching on it.

OWNER Afiq GROUP Fix with CHT-6, CHT-7

△ Two screenshots referenced but not retrievable — request from Dalson doc #382

CHT-6

P2

DEGRADES

Dalson

NEW #381

Historical pricing URL returned even when no pricing record exists

Querying an item/customer combination with no history still returns a link. The user clicks through to an empty page. Should return "no historical pricing for this combination" and no URL.

OWNER Afiq GROUP Fix with CHT-5, CHT-7

△ Two screenshots referenced but not retrievable — request from Dalson doc #381

CHT-7

P2

DEGRADES

Dalson

NEW #380

One historical pricing URL per item instead of one combined filtered URL

Query ten items, receive ten links. Should always return **a single URL filtered to the items queried**. Ten links in a WhatsApp thread is not a usable answer.

All three historical-pricing defects are one feature — assign CHT-5, 6 and 7 as a single piece of work with one definition of correct behaviour, not three tickets.

OWNER Afiq GROUP One ticket with CHT-5, CHT-6

DIY

Split delivery across two addresses in one message — untested

A real DIY sample reads "split delivery to two places — 20 rolls here, 62 rolls there" **without naming the item**. Ivan's read: this is what their core users actually do. Untested at time of briefing.

OWNER Product to test → Afiq

Source: DIY briefing 28:02–28:37

Decision 01 is settled: the discount column defaults to shown. DOC-5 builds to that default. Holsen's two PDF items (DOC-8, DOC-9) leave this week's queue entirely — they move to SQL later and will reuse the SQL PDF generators, so template work on their current setup would be discarded. That takes two P1s off the board without writing a line of code.

DOC-1 P0 BLOCKS DIY Ladang

AutoCount PDF generation not pulling on either account

Downstream of INT-1 and INT-2 — with the connector inactive there is no source to generate from. Listed separately because it is what the client actually *sees* fail, and it needs verifying independently once the connectors are live rather than assumed fixed.

OWNER Integrations DEPENDS ON INT-1 · INT-2

Source: DIY briefing 39:46–40:08 · Ladang briefing 19:03–20:15

DOC-5 P1 BLOCKS Dalson NEW ✓ DECIDED

Quotation PDF missing the discount column — build to default show

Dalson use discounts on quotations and the PDF does not reflect what the front end shows. **A quotation that understates the discount is a quotation the customer will dispute** — this is a commercial document, not an internal view.

Product ruling: discount column defaults to shown. No conflict to resolve and no further product input needed — this is straight build work against the default.

OWNER Backend — template STATUS Unblocked, build to default

▲ No screenshot delivered — request from Dalson doc item 1

REFS no Lark / Jam link supplied

DOC-8 P2 AFTER Holsen NEW ✓ DECIDED #391

Invoice PDF missing the discount column — carried to the SQL migration

Same defect as DOC-5, different document type and account. **Deferred: Holsen move to SQL later and will reuse the SQL PDF generators**, so building this against their current template would be thrown away.

Two things to keep visible so the deferral doesn't quietly become a loss: it needs to be **on the SQL migration checklist**, not just off this week's board, and Holsen should hear that the invoice discount is coming with the migration rather than being ignored — they raised it in a training session and will notice if it stays broken with no explanation.

OWNER Carry to SQL migration scope STATUS Out of this week's queue

▲ Screenshot referenced but not retrievable — request from Holsen doc #391

REFS no Lark / Jam link supplied

DOC-9 P2 AFTER Holsen NEW ✓ DECIDED #390

SO PDF shows an auto-populated discount — carried to the SQL migration

Holsen's position: the SO is customer-facing, so a discount *derived* from the gap between entered price and standard price should not be displayed.

Deferred with DOC-8 to the SQL migration and the SQL PDF generators. The product default is show; Holsen's exception gets handled at migration rather than as a custom template branch now.

One thing to carry forward: their objection is not really about the column, it is that **a derived discount is being presented as a granted one**. That distinction is worth resolving in the SQL generator rather than reproducing the same confusion on the new stack.

OWNER Carry to SQL migration scope STATUS Out of this week's queue

LG Lean Giap — AR/AP track Jermaine + Eric — new lane

4/5

UAT ran yesterday and was not signed off. The client wants further testing with real, varied transactions before accepting. This lane is mostly decisions and data, not code — **keep it out of the main fix queue** or it absorbs attention it doesn't need. Finance tests this week; Operations only next Monday or Tuesday because this is their peak week.

LG-5

P0

BLOCKS

Lean Giap

NEW

Order Intake, AR and AP feedback sheets are unread — content did not come through

All three feedback sheets were embedded as click-through images with no retrievable link. **The account that did not sign off is going into this war room represented by four bullet points**, while the actual client feedback sits in three sheets nobody in the room has read.

This is the single highest-value thirty minutes available today: whoever holds Lean Giap pastes the sheet contents in before 10:00. Until then, any triage of this account is guesswork.

OWNER Lean Giap PM — before 10:00 TYPE Intake, not engineering

LG-2

P0

BLOCKS

Lean Giap

NEW

Eric to sync latest Epicor data by end of today

Committed by the client for **end of day today** so Finance can test against current data. If it slips, Finance's testing window this week is lost and the whole retest schedule moves right — including the Operations window that already can't start until next Monday.

Chase it this morning rather than discovering at 18:00. A client-side commitment with no internal chaser is a commitment that quietly doesn't happen.

OWNER Chase: Lean Giap PM · Do: Eric (client) DUE EOD 4 Aug

LG-3

P0

BLOCKS

Lean Giap

NEW

Decision: can AR/AP go live before order intake?

Finance want to start on MAIA immediately; Operations cannot test until next week. The client is asking to decouple the two.

Lean Giap's AR and Macro Frozen's AR are separate builds, so there is no delivery collision and Macro's 15–21 August date holds either way. The remaining question is narrower than it looked: **what AR reconciles against while order intake isn't live**, and whether a partial go-live sets a servicing precedent across the portfolio. With the collision gone this is now mostly upside — see decision 02.

OWNER Ivan + Jermaine MACRO AR Separate build — unaffected

☐ LG-4 P1 DEGRADES Lean Giap NEW

LOTTE supplier matching logic — spec agreed, needs building

Fully specified by the client, which is unusual and worth banking:

- Confirm extracted supplier name is `LOTTE CHEMICAL TITAN (M) SDN BHD`
- Extract the **Customer Code** from the supplier invoice
- `B0060004` → LOTTE CHEMICAL TITAN (M) SDN BHD (**CBD**)
- `B0060005` → LOTTE CHEMICAL TITAN (M) SDN BHD (**15D**)
- Code missing or unmatched → **leave for manual review; never fall back to another LOTTE entity**

That last rule is the important one and it generalises: **when the disambiguating field is absent, stop — do not guess**. Exactly the discipline missing in SRCH-10, where an unmatched customer silently becomes a cash sale. Worth adopting as a matching principle across the product, not a Lean Giap special case.

OWNER Extraction + backend GENERALISE "No field → manual review" rule

☐ LG-1 P1 DEGRADES Lean Giap NEW

UAT not signed off — retest schedule needs a defined acceptance bar

The client wants further testing with real and varied transactions before accepting. Finance tests this week, Operations next Monday or Tuesday.

The risk in "the client is testing and will share more feedback" is that **there is no stated bar for what constitutes acceptance**. Open-ended retesting with no defined exit is how an account stays 90% done for six weeks. Agree with them now: which transaction types, how many, and what result counts as sign-off.

OWNER Lean Giap PM + Wan Sin DELIVERABLE Written acceptance criteria

STK / UI **Stock movement view & interface polish** Amirul — OUT · park this lane

0/10

Explicitly park this lane today. Ten items, none of them P0, all deferrable to Friday. Listed for completeness so nothing is lost — not so anyone spends an afternoon on a frozen table column while fulfilment is broken.

☐ STK-1 P1 DEGRADES DIY

Stock movement API call does not pass the warehouse filter

The view breaks down by warehouse but the call omits the filter, so the numbers shown aren't the numbers asked for. Data correctness, not layout — the only item in this lane that isn't cosmetic.

[↑ contents](#)

7 · SIX ROOT CAUSES

Seventy-four items is a number that makes a team feel besieged. Six causes is a number a team can act on. **Cause 06 is new today.**

CAUSE 01

Integration activation isn't gated by anything — it's assumed

Two of five accounts reached UAT week with the connector never activated. Onboarding already names integration access as a Stage 03 prerequisite. The gate exists on paper and nothing enforces it, so the failure recurs.

The DIY case is worse than "not done": the connector is bound to *FixGuru's* database, so activation is a per-client provisioning step nobody owns end to end. **Until integration readiness has a named owner with a date rather than a checkbox, this repeats on every account.**

CAUSE 02

The line item has no single source of truth — and today added a third place where UOM disappears

CALC-1, CALC-2, CALC-3, SRCH-8, EXT-2 and now FUL-2 are one defect wearing six costumes: **extraction, mapping and the front end each hold their own version of a line item and none defers to the others.** Extraction keeps 4dp, mapping rounds to 2. The item carries a UOM; mapping drops it; stock entry doesn't display it either. The chatbot and PDF render three delivery dates, the front end renders one. Deleting a row recomputes nothing.

Fixing these individually is six tickets that will produce a seventh. **Ask Jermaine for the line-item contract — precision, field set, ownership of recompute — before assigning any of them.**

CAUSE 06 · NEW TODAY

The chatbot acts on the data and the front end doesn't know

CHT-8 is the clearest case: the chatbot converts a CPO to a draft SO and the front end still shows a CPO. EXT-2 is the same shape — the chatbot and PDF have the delivery dates right and the front end doesn't. The historical-pricing URL defects (CHT-5, 6, 7) are the same problem from the other side: **the chatbot has no reliable model of what document state the user is currently in**, so it can't decide which page to send them to.

This is the failure mode most likely to produce **duplicate documents in a live client pipeline**, and it will get worse as more actions move into chat. The dual-interface mandate was always that the chat surface should be as rich as the web one — this is the bill for the two surfaces not sharing state. Worth a design conversation on Friday, not just four fixes.

CAUSE 03

Matching runs on heuristics alone, and the fix is a single point of failure

Every account produces match failures no string comparison will solve. The named fix — RAG / vector search — **is unbuilt and owned by Ivan personally**, alongside the UATs, the sprint plan and account triage.

Today's Dalson document extends the problem from items to *customers* (SRCH-9, SRCH-10, SRCH-12) — so the weakness now shows on both sides of the record. **Either it gets a named engineer and a date this week, or the honest position is that matching quality doesn't improve this quarter** and the client story says so. SRCH-11 (match on description) and EXT-4 (extract buyer SKU) are cheap partial mitigations that need no RAG at all.

CAUSE 04

Extraction stops at header level; these clients trade at line level

Line-item dates, line-item remarks, buyer SKUs, quotation references — all missing, all at the line rather than the document. Dalson's POs run seven pages precisely because the detail lives per line. Ladang's signature use case is three lines of one SKU with three dates.

Some of this is schema, not extraction: **there is no note field at line-item level for the data to land in.** Separate the two before ticketing, or extraction gets handed work with nowhere to write.

CAUSE 05

Field-level QC still isn't happening before client sessions — and Holsen proves it

Yesterday's forty-eight surfaced in three hours with Ivan driving the clicks, one day before UAT. Today's evidence is worse: **Holsen's eight items came out of a training session**, meaning the client watched picklist and delivery-note submission fail in front of them. Lean Giap's UAT ran and did not sign off. Dalson's questionnaire is still unfilled.

The cadence has a Tuesday Tech Lead QC gate, but it's scoped to features, not to client instances before a session. **Nothing in the current design would have caught any of this.** That is structural, it belongs to Friday, and it is worth more than any ticket on this page.

8 · NOT-TECH BLOCKERS & OPEN DECISIONS

These don't belong to tech and must not absorb war room time. Listed so they get owners this morning and are chased in parallel.

- **CARRIED, STILL OPEN** **Dalson questionnaire was never completed by the client.** A blank template was mistaken for a filled one, so scope is unverified going into Thursday. The live session with the client was actioned yesterday — **confirm it is actually booked**, with Gareth sending and Ivan attending
- **BLOCKER** **Lean Giap's three feedback sheets are unread.** See LG-5. Highest-value half hour available today
- **BLOCKER** **Holsen has no date attached.** Eight items including three POs from a training session, and no UAT or go-live date anywhere in the material. An account with broken fulfilment and no date is an account that drifts — give it one this morning
- **BLOCKER** **Sample coverage is thin.** Dalson supplied 5 POs against 20 requested; DIY supplied 6 documents. Failure modes we haven't seen are the ones the client finds
- **DECISION** **DIY delivery-trip module does not exist.** They bought MAIA Lite *with* Delivery Trip; estimate is mid-to-late September and it is the capability that matters most to them. Interim is Excel and they've accepted that — but the date must be stated in the session, not left floating
- **DECISION** **DIY commercials: RM1,000/month, quarterly upfront, subscription starts on go-live.** A rescheduled UAT is therefore a revenue-timing decision as well as a delivery one. Name it rather than discovering it later
- **CLIENT INPUT** **DIY WABA setup pending** — phone number ID, business ID and token from the client's Meta account; Chatwoot returns a link to attach back. Telegram already live. Send a written instruction pack rather than requesting credentials ad hoc, and make it an SOP — every WhatsApp client hits this
- **CLIENT INPUT** **DIY SKU clarifications outstanding** — which SKU Bubble double H40" and Stretch film clear w500mm × 1.7kg × 200g map to. Jun Yan with client
- **CONFLICT** **Dalson's UAT date still doesn't agree across sources** — Thursday in its own briefing, Wednesday in the 3 Aug standup for the cash-sales session. Resolve before sequencing anything
- **CAPACITY** **Amirul is out; Afiq owns three lanes.** SRCH-7 has been open since Friday with no cover. The bench is the constraint today, not the ticket count — and no amount of prioritisation fixes a lane with one person in it

9 · SOURCES & CONFIDENCE

Raw transcripts used, not AI summaries — Fireflies summaries over-attribute actions to the meeting organiser, which would have been actively misleading here

- **DIY Ventures UAT Brief from Jun Yan** — 50 min, 3 Aug
- **LADANG UAT Brief from Jun Yan** — 42 min, 3 Aug
- **Dalson UAT brief by Gareth** — 75 min, 3 Aug
- Six gap documents: DIY, Ladang, Dalson (3 Aug), Dalson (4 Aug), Holsen training gaps, Lean Giap UAT feedback
- 22 screenshots from the 3 Aug documents, retained and embedded
- Cross-checked against the 3 Aug daily standup for cash sales and capacity

Retrieval attempted and failed: every attachment in the three new documents arrived as [This type of content is unavailable for download at the moment.]; Lean Giap's three sheets arrived as unlinked images. The raw files were checked for hyperlink relationships, not just the rendered text — **no URLs were present, so there was nothing to fetch.** Twenty items below carry an evidence warning

Confirmed by Ivan, 4 Aug — items carrying a ✓ badge are settled, not proposed: the AutoCount non-prod 500-record write limit is an accepted platform limitation (INT-4); Lean Giap and Macro Frozen AR are separate builds with no collision (LG-3); the discount column defaults to shown (DOC-5); Holsen's PDF items defer to the SQL migration and reuse the SQL generators (DOC-8, DOC-9)

Reference links: Lark and Jam links are preserved as clickable refs on their cards. Only one survived the upload — Ladang's Jam capture on EXT-2. Cards with missing evidence carry a dashed empty ref slot; paste recovered links straight in

Confidence: findings are *evidenced* where a screenshot or reproduced case exists, and *reported* where they rest on a single line in a document. Items from the new documents are largely reported-only. P-levels and owners are **proposed by me, not agreed** — Wan Sin owns triage; this is a pre-read for her decision, not a substitute for it

Known unknowns: Dalson's UAT date conflicts across sources; Holsen has no date at all; Lean Giap's substantive feedback is unread; several items marked "untested" are risks rather than confirmed defects and are labelled as such

The thing worth resisting today. The pull will be to work down the list and feel productive. Twenty-seven blockers across five accounts in one day, with a developer out and one engineer holding three lanes, is not a plan — it is the shape of a week where all five accounts go badly instead of two going well. Concentrate: close the fourteen POs, make three go/no-go calls before lunch, get the four product decisions off the engineers' desks, and let the rest wait for Friday. Macro Frozen went well for exactly this reason — the flow was known start to end before anyone walked into the room.
